               Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

You seem to be the sophisticated type, so I suppose you would find the
enormous black tower in Broderbund's "Stealth" ("Landscape") appealing.

Anders

What is the fixation with the Spectrum's rubber keyboard? The rubber
keyboard lasted from something like 1982-1985. Every Spectrum made after
1985, up until approx 1993 or so when they stopped making them, had
plastic keys. And the Amstrad-made ones have a similar typing action to

Mitsumi keyboards.

Heh. I'm currently slapping together a box just to run your program for my Atari out of stuff I had in the closet and crap my friends have given me. When I get it completed, I'll give it a whirl. But for the time being, I think I'll leave my current installation of AtariSIO alone 'till then.

Also, what is the likelihood of an internet modem and maybe printing support in this version? ;)

Slipping/loose drive belt maybe? If you're not afraid to crack open the
case(s), do so and look at the drive belt. If it's lost it's tension, it
can't spin properly. If it looks like it's tight enough, try pulling the
belt off the drum and motor and wiping it down with some rubbing alchohol.
20 years of dust can really screw things up after a while.

And yes, there are/were drive head cleaners available. I bought several of
them years ago at a small computer store back home. Cleaners for 3.5" are
easy to find, but for 5.25", you might have to go to Fry's or find 'em
online somewhere. When I bought mine, each cleaning kit came with one 3.5",
and one 5.25" cleaning disk.

Sounds like somebody uses Cedega. Great prog/utility, ain't it? :)

>
> Not counting literally hundreds of non-commercial apps and games that are

Wine is great, too, is it not?

>
> Who needs Windoze...not me! :-)

Wish I could say that. Until Cedega matures a little more, I'm stuck with
Windoze for a select few games. But they are constantly adding games to
Cedega's supported list.

If you wanna try your hands at a 100% *FREE* MMORPG game, go check out
PlaneShift, an open source mmo. http://www.planeshift.it It has some
absolutely gorgeous graphics, too.

It could also be your barrings. You can get them repaired at places like ATY
Computers, B&C Computers or Best Electronics.

It you want to connect your 8-bit to a monitor you could do what I have done.
I just bought a video convertor. The RCA Video part of your cable would plug
into that and then you can use any PC VGA monitor. The audio plug would just
into any powered speaker. I use it a lot and it works great, much better than
a regular TV connection.

Hello Tom,

When I was working a lot with the Atari 8-bit computers, I used a
non-standard operating system ROM with built in monitor to tweak and test
most of the stuff. I had Q-meg, Bibomon, and Supermon installed, each
helping in their own way.

But nowadays, it's best to work with a PC based cross-assembler like ATASM.
Most programs can be found on Ken's Atari 8-bit zone:
http://atari.ksiders.tzo.com/a8programming.html but when you're really
trying to do nice things on an Atari 8-bit computer, you need to read a lot
aswell. To get some more examples on 6502 programming, I'd recommend
http://www.6502.org/source/

As far as I know, it is not yet possible to run the Mac/65 Cartridge on the emulator, but since I don't have the cart image, I can't be sure.

Hope to have helped.

Arianne Slaager (Alphasys)

No OS patchiing required on the Amiga either, and the A1200 must just be
faster.

You have to get the right revision ROM or the onboard IDE isn't supported
(granted most have the right ROM), PCMCIA is crippled with certain RAM
expansions.

 Wasn't stunt car
> racer an issue too (WB2)?

Nah, none of my Amigas ever had a problem with it.

We used to run an Atari Vs an Amiga using null
> modem, great fun. Atari had the minor frame rate advantage.

Did it, I never spotted it when doing the same. Plenty of Amiga specific

titles were dumbed down to make them work on ST ;-)

I thought it was Aussies that liked egg on Pizza? Besides the reality is
there are plenty of demos as good as each other on both machines. It
would be like comparing Coke to Pepsi. I prefer pepsi.
I have seen awesome demos on BOTH machines. In the end Atari programmers
are as good as Amiga ones.

Did you answer these?

How many mips is the A1200? 1.6? Not even close to the Falcon on its worst day, crippled or otherwise. A 68030+65001@16Mhz combo is always going to out do a 68020@14Mhz, especially after dropping a 68882 into the equation;-). Does the A1200 have a copro?

Again if you concede that the A1200 can be made to appear faster than a Falcon then the same can be said for the STFM v A500. And believe me I have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth scrolling even on a stock STFM, every bit as good as an A500. One demo I saw was having a crack at how badly Shadow of the Beast was coded (ported) to the ST. It had all the elements of what Psygnosis should have done. The bitmap brothers could do it, why couldn't psygnosis.

Incedently they sorted their shit out a little better after that, because of the crappy reviews. The Amiga was useful because it showed up their programming, or lack thereof.

An '030 Amiga will kick your arse performance wise since it isn't crippled by a 16 bit bus, and an '020 isn't significantly slower then an '030 at the same clock speed. Like someone else said, the bottleneck in the system architecture means actual system performance isn't as significantly better then an A1200 (as you might not expect just looking at numbers)

The A1200 doesn't have a copro as standard but in any case that doesn't increase system performance significantly, only certain apps that use the copro.

> Again if you concede that the A1200 can be made to appear faster than a
> Falcon then the same can be said for the STFM v A500.

It's not a question of appearance so much as the system architecture.

And believe me I
> have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth
> scrolling even on a stock STFM, every bit as good as an A500.

Well I haven't, State of the art, Nine fingers, Jesus on E's... name your favourites so I can compare some demos.

One demo I
> saw was having a crack at how badly Shadow of the Beast was coded (ported)
> to the ST. It had all the elements of what Psygnosis should have done. The

Xenon II is much better on a A500 then on an STFM.

> Incedently they sorted their shit out a little better after that, because
> of the crappy reviews. The Amiga was useful because it showed up their

You would like to believe that but I'm not convinced. Lets agree to disagree ;-)

F1GP-Ed fixes this...

"If you run the game at high frame rates (20+ ???), then go into race mode,
and sometimes in other modes, the car will spin to its left around its
axis. This is probably due to some calculations (the game makes)
overflowing, as it was not intended to be run at high frame rates."

From the Amiga F1GP website.

Nope, they were straight ports.

There is nothing an ST can do that an A500 isn't capable of.

And a Atari TT030 will wipe the floor with an A1200 too. But an A1200 is
no competition in terms of horsepower compared to the holy trinity of
68030+68882+65001. How many mips is the A1200 capable of? The DSP on the

Falcon alone is worth 16. That is about 10 times the A1200. Correct?
>
> The A1200 doesn't have a copro as standard but in any case that doesn't
> increase system performance significantly, only certain apps that use the

You should see the Falcon demos that do, very nice. A 68882 is much more potent than even an 030 at maths, and significantly better than an 020.

So because you haven't seen it, it does not exist? Well sorry it/they do. Froggies over the fence has nice 4096 colour piccies on a STFM and have a google for the overscan demo.

True not ALL Bitmap brothers stuff is as good as the Amiga. The Chaos Engine is sweet on an Atari. And there are games on the Atari better than the Amiga.

Those were the games that failed. Crappy programmers that didn't
optimise the software for the hardware. Awesome Amiga programmers,
crappy Atari programmers.
>
> There is nothing an ST can do that an A500 isn't capable of.
>

The only thing I have not seen an STFM not do that the A500 could is
stereo. There is a tweety board that allows stereo mind you. And Atari
corrected the issue with the STE, as well as hardware scrolling they
added DMA sound and increased the palette. There is nothing an A500 can
do a STE cannot.

Thanks for the Info, What needs to be done to the Falcon to get it
running with it
if ya know?

I'd like to use it on one of mine.

But as already stated, the "default" limits of the attributes can be easily
overcome.

Not in California or New York; Gay Porn is a multi-million dollar
industry.
I am hard pressed to think of where in Europe laws like that would be
enforced.
In *one* of the Middle Eastern countries, it is legal to have sex with
an animal, as long as it is male.
Ok, the last one wasn't from a credible source.

No matter where you are, you'd have to be in the public square, or
trespassing (as this guy was),
or filming the loudest gaygasm, to be caught at such an activity.

Someone should make a ZX81 demo ala ZX-Team's adult-model demo.
Pixellated buggery!!
Imagine the profits!!! Charge people an outrageous fee to UN-register
their gayware!!!

Sorry. I'm wanting to bugger the MS-SDK development team for making it
so obscure on how to
apply an icon to the titlebar of an app. Oh, and it's 3:25 a.m .

Bill Garber wrote:
> Why all you guys don't read? I said caught taping, not having sex.

So why would taping two men having sex result in a 10-15 year prison
sentence?

Moral questions aside (IMO there's nothing wrong with porn, gay or
straight, as long as everybody involved (including the viewers) is a
consenting adult), there is (judging from some of the spam I get) a
thriving gay porn industry, and AFAIK, they're not operating from inside
prison walls.

Ah.

Well, Carrier Command on the Spectrum was a full filled-polygon 3D
strategy/action game with 32 islands, aircraft, amphibious vehicles, and
actually improved gameplay over the Atari ST version.

The C64 version was a 2D affair, that lacked any impressive features found in
the Speccy version.

Starglider on the Spectrum was again an improvement over the ST version with
improved sampling of the on-board computer, and better model and animation
design of the 3D craft in the game.

the C64 version contained no sampled speech, slower animation and lacked decent
model design.

Starion is possibly the fastest Vector game on the Spectrum. The C64 has no such
game of the same speed.

They're all vector games, and they don't exactly turn us C64 owners
green with envy. The same stuff is perfectly doable at the same
framerate on the C64, especially if you limit yourself to a 256 pixel
wide window like the spectrum games. Still, 3D games are slow and
never really worked well on 8-bit machines. The Amiga and ST had some
decent 3D games, but you didn't really get interesting environments at

decent framerates until the 486 came out.

Are 5 fps wireframe games really the best action games the speccy had?

MB> always going to out do a 68020@14Mhz, especially after dropping a
MB> 68882 into the equation;-).

Of course, I wasn't arguing that. I said that the 14 MHz 68020 in the
A1200 is roughly as fast as the 16 MHz 68030 in the Falcon. Their
custom chips have different strengths, and which is faster depends on
what you're trying to do. If you're memory bound (blitting a bunch of
moving objects), the A1200's memory bus is 63% faster than the
Falcon's. If you're doing lots of calculations (say 3D graphics), the
56001 and 68882 are a huge benefit.

MB> Does the A1200 have a copro?

A 68881 or 68882 is supported, but not included in the base model.
However, if you consider the launch date and price, you should
probably be comparing the Falcon to the A4000/030, which had a 030/25
with 68882 as standard.

<puzzled look on face> I don't see how you get that. I mean, when I saw an
A4000 for the first time it was *expensive*.

My first Falcon in '92 was $799.00 - I did add a HD and some other stuff
but it still was well under a $1000 here in the US.

Maybe Atari had a special intro price in the US? When the Falcon 030
was introduced in Sweden during early spring 1993, the recommended
price including a 64 MB hard disk was around 16000 SEK ($2100). As
MagerValp indicated, you could find a similar Amiga 4000/030 for
a few thousand SEK less. A MIDI interface was only a few hundred
crowns, so you almost could afford one more funky item of upgrade
before you reached the list/sale price of a Falcon.

Of course, the 4000 would not have a DSP, which IMHO might be the
only hardware thing which makes the Falcon superior for its cost.

Vector games suck, give me Turrican II anyday.

The A4000 was a big box easily expandable machine, ofcourse it cost more.

MIDI is absolutely useless without additional hardware... and subsequent
cost.

$29.95 bought you an Amiga MIDI interface should you need it, and support
was built into the serial port.

No, I would dare suggest such a thing, but it is simple truth from the
prgrammers themselves that such things were done.

I've yet to see a 3D game from the C64 that is AS good as the spectrum version.

Hello,

please excuse the cross-posting, but I thought that maybe somebody from these three groups might be able to help me along a bit.

I'm not new to the C language or to 6502 assembly language, but I'm new to cc65. I want to write a program in C using cc65, but I need to integrate a small piece of cycle-counted assembly code to do low-level disk writes with the correct timing; the Apple hardware is very picky in this regard, so it's impossible to use compiled code.

I'd like best to use inline assembly ("asm") statements inside a C frame function, but the code is not allowed to cross a page boundary, since this would destroy the timing of branch instructions; and it seems that ".align" is not allowed in asm statements. Is there any way to tell the compiler that you want a piece of inline assembly to be page-aligned?

If I can't use inline assembly, I'd need to know how to interface assembly and C code. Especially, how do I access function parameters of different data types from assembly language, how do I return values, and how can I use temporary storage in the zero page without interfering with whatever the compiled code does on the zero page. The cc65 documentation is largely silent on these matters, and while I've looked at a few pieces of assembly code produced by the compiler, I found it rather convoluted and not that easy to understand.

I understand that there's a software-implemented stack, using "sp" for a stack pointer / base pointer, local variables and parameters are both stored on this stack, and addressed with "(sp),y" type instructions, and that for a number of stack manipulation operations, there are a couple of standardized "jsr"s to library code; but exactly how the different data types are stored remains unclear to me, also how to use zero page in a compatible way.

If anybody could help with hints or with just some sample code that I

could look at, I'd be grateful for replies in these groups. Given that
the resulting discussion will probably be of some interest to the people
in these three groups, I've not set a "Followup-To:"; if you're
absolutely against cross posting, feel free to reply in just one group.

If there are any web forums or mailing lists where this question is more
likely to get useful answers, I'd be also grateful for a link.

Many thanks in advance!

>>>>> "TS" == The Starglider <thestarglider@wibble.co.uk> writes:

MV> Are 5 fps wireframe games really the best action games the speccy
MV> had?

TS> And again, Starion?

We already established that the speccy gets a slightly better frame
rate in 3D games in the first csc vs css flamewar. Starion's speed is
quite decent when there isn't too much on the screen, but a starfield
and some simple wireframe graphics doesn't make me go wow. The Masque
by Oxyron shows complex 3D objects at a nice framerate, if you're into
that kind of thing:

  http://noname.c64.org/csdb/release/?id=820

As we already discussed back then, a lot of the gain is due to the
Spectrum's lower resolution - if you use reprogrammable charsets on
the C64 to build a 256 pixel wide screen you get a similar speedup,
something that C64 game programmers failed to exploit in the 80s.

That was probably the A4000/040, which costed a lot more than the 030
model.

RJH> My first Falcon in '92 was $799.00 - I did add a HD and some
RJH> other stuff but it still was well under a $1000 here in the US.

I honestly don't remember the prices anymore, but unless I'm mistaken
the A1200 was about half the price of the Falcon back then. I paid
somewhere around $500 for my A1200 in 1993.

If you're worried about where your code lives, relocate your code
somewhere else during program initialization, and jump to it. This
is essentially the approach used for assembly code embedded in Applesoft
programs. Write some inline assembly that calls the function at the
fixed address.

The way you carefully avoid interfering with zero page is to save and
restore the zero-page values on entry and exit. You won't be using
interrupts since your code is timing-critical, so there's no race
condition.

>>>>> "LT" == Linards Ticmanis <ticmanis@gmx.de> writes:

LT> I'd like best to use inline assembly ("asm") statements inside a C
LT> frame function, but the code is not allowed to cross a page boundary,

Unfortunately, this rules out inline __asm__ statements.

LT> If I can't use inline assembly, I'd need to know how to interface
LT> assembly and C code.

Sure thing, it's simple enough. The software stack is implemented with
a zp pointer called sp. It starts at the top, and moves down as items
are pushed on the stack. You can .importzp sp and access it directly,
but it's easier to use the built in library calls for manipulating the
stack. When your code is called, the arguments are pushed onto the
stack left to right. If you declare your function __fastcall__ the
last (rightmost) argument will be in A/X instead of on the stack,
which saves a few cycles. Your code is responsible for pulling all the
arguments off the stack, so if you have e.g. 4 bytes of arguments, sp
should be increased with 4 before your code exits (2 if you use
__fastcall__). The return value should be in A (lo) and X (hi). X must
be set even if you just return a single byte, as cc65 doesn't clear X
for you if the value is cast e.g. from a char to an int.

Some of the available library routines are:

```
  popa        pull one byte off stack, increase sp by one
  popax         pull two bytes off stack, increase sp by two
  pusha         dec sp byte one, push one byte onto the stack
  pushax        dec sp by two, push two bytes onto stack
  incsp1        increase sp by one
  incsp2        increase sp by two (and so on)
```

Here's a silly example that copies 1-128 bytes from src to dst, and
returns the length:

-- main.c --

```
#include "copyshort.h"

void main(void) {
  copyshort(10, 0x1000, 0x2000);
}
```

```
-- copyshort.h --

/* copy 128 bytes or less from, returns bytes copied */
extern unsigned char __fastcall__ copyshort(unsigned char len, void *src, void
*dst);

-- copyshort.s --

     .export _copyshort ; prepend labels with _ so C can see them

     .import popa, popax
     .importzp ptr1, ptr2

src  = ptr1             ; borrow runtime zp pointers
dst  = ptr2             ; tmp1 and tmp2 are also available

     .code

_copyshort:
     sta dst            ; __fastcall__ so last arg is
     stx dst + 1        ; in A/X

     jsr popax     ; pull src off stack
     sta src
     stx src + 1

     jsr popa      ; pull len off stack
     pha           ; save len for return value
     tay
     dey
:    lda (src),y
     sta (dst),y
     dey
     bpl :-

     ldx #0             ; return len in A/X
     pla
     rts

Actually you don't have to be. That's not the most impressive example
but OTOH we shall be _really impressed_ if you show something even
remotely similar on the Speccy.

OK. So you want the machine to have abilities w/o hardware... do I
understand correctly?

> The C64 has sprites... so does the spectrum. Hardware or not.

Does it? Or you have to simulate them in software? Good luck in getting
eight of them refreshed _seamlessly_ per raster frame.

>
> Do you understand now?

Yes. We don't take hardware into consideration and then we compare the
abilities of... what? The users' imagination?

Please show the example, regardless of how it does it.

8x1? Ok, show that too, regardless of the 2x1 possibility on the 64

Here you may be right as long as you don't add quantifiers...

>

In many cases yes.

[...]

Why can't it run a webserver then? It's mostly the number crunching
dependent. 64 doesn't make any use of its specialised VIC/SID chips to
do that and number crunching is the only thing Speccy undoubtedly can do
as good as a 64 or even slightly better sometimes ;-)

> the particular blue of the sky, ergo it is night)

Not really - until you show the appropriate examples. Until then it's
just that rather than accepting the facts, the answers are "Well, even

if it is a day, I can always do a workaround like paint the windows'
glasses black. This takes some time but it proves that it is not day
outside"... ;-)

Could be that Speccy users learned some thricks to do that in the
meantime. Still far from what 64 can do but alright, I was wrong writing
8x8. What about the other points?

No, the DIN connector wasn't present if that is what you mean. I had a
sampler with built in MIDI but I never used the MIDI side of it.

Starglider is back every year to troll this group. Not sure why, nothing is
going to change.

Well, as of now I saw only two colours in 8x1, which is still "somewhat"
beyond what a 64 is capable of

> sprites,

Really? Where's the example of "as many" and "as fast"?

> sound

Don't know what the newer Spectrums can do about the sound but I still
remember the blirp, blirp, bzzt, beep of my first (and last) ZX Spectrum
from 1984. Could this one play (even digitised) SID-alike tunes? Serious
question.

When one is determined enough in one's faith, trivialities like
rationalization and blatant, incontrovertible facts are merely
annoyances, and can be readily assumed to be nonsense.

> It's at this point that sheep look promising...

Or llama's, of course. For one, you can keep standing up. So if the llama does get mad, you can get away quickly. And llama's are warm and woolly too, just like sheep. Llama's do tend to spit a lot, but that might actually come in handy if the llama is of the male gender. Llama's are rather more sexy than sheep, I've allways thought. Llama's ears are more attractive too.

Unfortunately as standard there was only an empty socket in this
machine. One had to put the 68882 into it on its own, but... the
A4000/030 came out to the market later than the A4000/040 and was a
crippled/stripped to the bones version of the A4000, good for all those
who were heading for an accelerator card anyway. The 68EC030 card looked
like it's been put inside just to show that it can actually boot and is
not DOA ;-)

I personally think Starglider has issues that go way beyond system advocacy.

I don't think I'm going to be the one to defend that claim (Spectrum demos don't seem to be particularly big on sprites), but I think you'll have to quantify that a bit more to be meaningful. How many sprites are we talking about, and what size, and what do they have to do?

Still, in the absence of any further criteria, I'll claim that a 1x1 bitmap is a perfectly legitimate software sprite, and nominate Ecstasy Megademo <http://www.zxdemo.org/item.php?id=2522> which features (IIRC) 1024 individually-plotted pixels at full frame rate. Don't bother to post any sneering comments about what a ridiculous comparison that is, I already know.

>> Q. Can the Spectrum display colours at a 8x1 attributes like the C64?
>> A. Yes it can (same as above)
>
> 8x1? Ok, show that too, regardless of the 2x1 possibility on the 64

We already did (although people seemed to rather miss the point and think that I was trying to demonstrate the most mindblowing Spectrum-generated graphics ever seen, as opposed to demonstrating a simple technical point).
http://www.zxdemo.org/extra/flamewar/clive_7colour.png

I think your claim of 2x1 attributes is an exaggeration or a misunderstanding though. Firstly because someone else in this thread explicitly said that 8x1 was the limit (although admittedly I did specify the extra constraint of 'no cheating with interlace'), and secondly, if you could get two colours in one 2x1 area, you wouldn't be boasting about 2x1 attributes - you'd be boasting about no attributes at all.

I don't think there's any reason why not in principle, just that
nobody's put the software and hardware together to do it yet. As far as
I'm aware, the main barrier to a port of Contiki is the lack of
fully-compliant C compiler.

This is also one of the reasons why I went from my 800XL to an ST. When I looked at the prices of a 520ST and the A1000, there was no comparison. I would have had to rob a bank to buy the A1000.

It was a bargain, no doubt.

I said: "*in this mode* the C64 is limited to 8x1 attribute regions.". I
didn't say the C64 couldn't do better than that. Unlike the Spectrum the
C64 has many screen modes and tricks up its sleeve. See also:
http://www.studiostyle.sk/dmagic/gallery/gfxmodes.htm

For example with sprites it is quite easy to fill an area with more
colors than would normally possible for a given screen mode.

I see no reason why a ZX Spectrum couldn't potentially run Contiki.
Contiki doesn't really take advantage of the graphics and sound
capabilities of the C64. Screen resolution aside, Contiki should run at
least as well, if not better (thanks to the faster processor) on a ZX
Spectrum than on a C64.

I'm pretty sure that there are decent enough C compilers for the Z80.
The C compilers for the 6502 aren't fully compliant either. The Z80 with
its 16-bit registers and larger stack, is much more suitable for C
programs than a 6502.

According to the Contiki homepage there are already some ports underway
for Z80 based systems. So I'm quite surprised no one has bothered to do
a Spectrum port of Contiki.

According to this website:

http://www.amigahistory.co.uk/a4000.txt

and the official Commodore announcement, an A4000 with a 120meg HD was
offered at a MSRP of $3699.00 which is way over what I paid for my Falcon
with a HD.

--
_/_/_/

control commands (like .align) aren't accepted. A second reason is that the inline assembler code is processed by the the optimizer, and handling control commands in this stage would be too complex.

> Is there any way to tell the
> compiler that you want a piece of inline assembly to be page-aligned?

Alignment is done by the linker. If you want to embed your inline assembler code in a C function, you can place this C function in it's own segment using something as

```
#pragma codeseg (push, FASTCODE);

void fastcode (void)
{
    /* Your code here */
}

#pragma codeseg (pop);
```

Using your own linker configuration, you can the place the FASTCODE segment whereever you like. See the linker docs for more information on how to do this. The FAQ does also have a paragraph that talks about code placement:

```
http://www.cc65.org/faq.php#ORG
```

> I understand that there's a software-implemented stack, using "sp" for a
> stack pointer / base pointer, local variables and parameters are both
> stored on this stack, and addressed with "(sp),y" type instructions, and

> of standardized "jsr"s to library code; but exactly how the different
> data types are stored remains unclear to me, also how to use zero page
> in a compatible way.

MagerValp has already given a good example. I can add a few things here:

The low 16 bit of a 32 bit value are returned in A/X as with 16 bit values. The high 16 bit are returned in the zero page location named "sreg". If you're using inline asm, you don't have to care about the declaration, the compiler will do that for you. If you're writing assembler modules, either use one of

```
.import sreg:zp
.importzp sreg
```

or include the file "zeropage.inc", which will give you access to all zero page locations, the compiler knows about.

The following zero page variables can be used freely by assembler functions:

```
ptr1, ptr2, ptr3, ptr4
```

tmp1, tmp2, tmp3, tmp3

But beware, other functions will also use these locations, so if you're calling a subroutine, they may get clobbered.

regbank

is a 6 byte zero page space used for register variables. It has the disadvantage that any caller expects the current to survive the function call, so you need to save it somewhere. The advantage is that you can expect to behave other functions in this way.

For more examples on how to interface with assembler, just have a look at the library sources, which can be found in the source archive.

Regards

Uz

A 48K could not play SID tunes at any acceptable "resolution", because it only has a single-channel beeper. It's something like the old PC beeper, before IBM-compatibles had sound cards. However, you can do some neat tricks with it where you play two alternating notes at high speed and produce two-channel sound, and Tim Follin managed to get five or six channels out of the beeper - although this had a *lot* of fizzy background noise to it, and was more technically impressive than pleasant to listen to. Also, nothing else could happen at the same time (except maybe waiting for a keypress).

The newer Spectrums have the AY-3-8912 sound chip, which is not so different from the YM chip in an Atari. It's not as powerful as a SID, either. It can play three channels of any combination of tone and "noise", and it can also play fairly acceptable sampled sounds while leaving some processor time free to do other things. There's a nice demo called DigiSID (http://zxdemo.org/item.php?id=6086) that plays a couple of SID tunes through AY while also running a simple scrolltext. They're obviously not 100% SID quality, because the chip is inferior, but they still sound good :)

I believe there was another company that made monitors and they were
very popular at the time, began with A I believe, but I can't remember
the name.

Not all Falcon's had 68882's either. But Atari never made an 040 box
(past prototype). The TT030 I would compare to an A3000 and a A4000 to a
  Hades or Milan. The Falcon was still supposed to be a home computer.

Ok are we ready for the truth now;-). Or are we still playing?

Yet you bitch about buying another monitor? How well did Cubase or
Notator run on an Amiga? The Atari STILL has the best midi timing of any
  computer (thanks to the PC's open architecture) and are STILL used in
studios for that reason. Bars and Pipes, hehehehehehehe.......

Mark

PS Midi is very good at simple networking too. Try Substation or
Midimaze for example.

The Falcon has a built in line input as well as midi. Able to record at
16bits 50Khz stereo direct to disk. How about that stock A1200? How good
was its built in SCSI? 14 meg of ram? HD FDD (that runs at reasonable
speed). VGA and RGB support, resolutions I have got out of a stock
Falcon over 1280x1024. 6 joystick support analogue and digital. Able to
run virtual memory too. Cmon....

Mark

BTW thanks, I have dragged some of the older machines out and am
enjoying them again;-).

Being processed by the optimizer pretty much rules out using inline assembly I fear, since the Apple disk controller wants to receive a byte exactly every 32 cycles; one more or less and it won't work. So any kind of optimization or reorganization would destroy the functionality.

So I guess I'll use a separate assembly file and .align my code that way. There's no need to call any functions from the write code, it's just a simple loop that dumps memory locations' contents to the write register. And now that I know how parameter passing works, it should be easy enough.

One more thing, on the Apple many hardware funktions are activated by accessing certain addresses. It's only the access that matters, the data read or written is irrelevant. But when I use peekpoke.h and say something like "PEEK(0xC030);" without using the result for anything, it gets optimized away. I've settled on "*((char *)0xC030) = __AX__;", which gives a "pure" store, storing whatever is currently in A; but this is problematic for some addresses, since the 6502 accesses an address twice during a write. Some of these "softswitches" are toggle switches, so you need to read them, which produces only one access; writing them toggles them back and forth instead.

Is there any way to get a "pure" load, i.e. make the compiler emit just an LDA (or a BIT, or whatever) but to ignore the result? I mean without resorting to inline assembly. I tried to do it with "volatile" but that doesn't seem to have any effect.

(No need to answer this rather peculiar request, unless you feel like answering. I know I can just store the result to some temporary variable and forget about it, it's more or less a question on whether it's possible.)

For obvious reasons IMHO ;-)

>, but I think you'll
> have to quantify that a bit more to be meaningful. How many sprites are
> we talking about, and what size, and what do they have to do?

I think it's been said already. The C64 sprites have decicated size of
24x21 pixels (that's to answer the "size" question). Let's keep it so
simple and small then. They have to be moved on screen without affecting
the underlying (or overlying) graphics (no colour bleeding at all,
regardless of the colours chosen for the back/foreground vs. sprite).
They have to be moved on screen without _any_ noticeable jitter (raster
synchronised as not to get distorted). They have to do the above and be
in a number of - let's make it easy - 32, updated every frame. Of course
I'd love to see the 100+ (was it?) record of the 64 being beaten on the
Speccy while fulfilling the above criteria of "as many" and "as fast".

Yes, I already admitted that I was wrong (not up to date) here, provided
it's possible on every regular Spectrum and not only on the newer
clones/models

>
> I think your claim of 2x1 attributes is an exaggeration or a

You are right. I put it wrong. I was actually referring to the simple

"multicolor" mode, which combines two adjacent square pixels into one
with the addittion of extra "colour depth" and allows without any tricks
(read: software support exceeding initialisation) to display four
colours in four adjacent pixels. After adding the simplest "trick"
different colours can be applied to every line. Somebody already gave
the link to the article explaining the display modes on the 64.

That's what I refer to. IMHO Spectrum actually _can_ run a webserver. At
least I don't see any major obstacle for it to be done that would be a
result of the platform's limitations. Funny is that this was agreed as
impossible while things that are most probably not really possible
(sprites, more advanced gfx display) are claimed to be the ones so easy
achievable...

Monitors were damned expensive. $29.95 for a port that only a minority of people would have a use for is pretty cheap.

 How well did Cubase or
> Notator run on an Amiga? The Atari STILL has the best midi timing of any

You would like to think so, but I see Mac's and PC's everywhere in studios. The days of the Atari being a choice for the semi-professional+ are long gone.

Simple being the operative word there.

Not so, alot of sudios still use them as a master midi clock IIRC.
Because the timing is so poor on modern equipment. So, how well did
Cubase run on an Amiga anyway?
>

$29.95 is peanuts for those into MIDI, it would be the least of their
expense.

Professionals seem to be happy with it, I think

So, how well did
> Cubase run on an Amiga anyway?
>>

It doesn't, MIDI was the domain of Atari where Video was the domain of
Amiga. Despite that the MOD tracker format was by far and away much more
popular then MIDI anyway, and spawned many a talented musician.

Hmmm, "I" does not ring a bell. How about C.Itoh? Pretty sure they
made printers and monitors back in the day.

Anyway, thanks for the help plus you've just given me one or two more
fond memories.

There is no comparison between Mod and Midi. Especially when you get to
Cubase audio on the Falcon. I think there was a version that ran on the
ST/Mega/TT as well, using an external SCSI sampler.

So how many albums were recorded using the Mod standard? Midi was/is
more popular than Mod has/ever will be.

Mod was/is very popular on the Atari too. I found an scream tracker
player for the STE yesterday. Awesome stuff. Seems a mod player for the
STFM has been released recently too, capable of 50Khz playback. The guy
who wrote it (Paulo Simoes), would be the guy who wrote the fist
overscan demos in the 80's and has recently broken the sprite record on
the ST. He deserves a medal I think.

You do know that a stock STE is capable of 50Khz DMA stereo? Mods are
not an issue for anything made by Atari after 1987. STE, MegaSTE, TT and
Falcon.

That's because the Atari's YM chip is an AY8910 clone.

A volatile type would be great. I have a program that suffers from a
similiar problem, in that I store a value to a memory location to check for
the presence of hardware. If I check for that value in that location right
after the assignment, the optimizer optimizes it away. I got around it by
putting the check far enough down in the code from the assignment that the
optimizer doesn't remember it.

I hope that the optimizer knows enough to leave assembly code
unchanged. I presumed (oops) that UVB meant only that it "passed
through" the optimizer, not that the optimizer attempted to do
anything with it... ;-(

A good fallback position.

It is not true that all stores cause a read access. I don't know
how this myth continues to propagate. (Perhaps it's because of
the "double access" note about the Applesoft POKE function, which
occurs because that store is *always* indexed.)

Only indexed and indirect indexed stores cause a read access prior
to the write access (because of a data path conflict in the chip
which requires another cycle).

A volatile type is a necessity in any optimized language used to
access addresses when the access has side effects. As noted, the
Apple (and indeed, any 6502 machine) is loaded with such side effects.

One must also make some "policy" decisions about indirect accesses
(through pointers). Without explicit information to the contrary,
it is best to assume that a pointer *cannot* point to a volatile,
since to do otherwise would eliminate almost all optimizations.

I for one don't like my code computer-optimized because I lose control
over it.

Thanks. I was indeed thinking that every store instruction causes two
accesses. If not, the solution I gave above seems to be ideal, provided
you use an absolute address, not some expression that has to be
calculated at runtime (which will compile into an y-indexed indirect store).

It has been a while since I found anything interesting on local flea markets or the
various web marketplaces in Sweden, but I bought Adventure International's Sunday Golf for the Atari recently.

The box and the cover/manual really looks pre-industrial seen from a computer
gaming point of view. Simple cover art with a golfer and instructions text printed on the inside of the cover. If the cover art had not been in colour, the compact cassette box and the cassette itself would have looked quite home made.

I like that. If I decided to concentrate on collecting something in the classic computer games arena, it would probably be things that have signs of small scale business or computer hobbyist achievments.

Here is a web page (not mine) with information about the game.

http://www.ataricave.com/S/SundayGolf.htm

It's in the (German language if I recall) documentation for the
Falcon version of 800XLDJ. Let me know if you can't find it and I'll
look into it if you like.

    Here you go...

ftp://ftp.atari.art.pl/stuff/mirror/atari.fornax.sk/pub/atari/8bit/Emulators/co
mp/800xldj.lzh

    That is on the XLSearch site.

    800XLDJ uses an SIO2PC cable to have the Atari ST/TT/Falcon (Well, I've at
least gotten it to work on a ST and STE) to act as a virtual drive. Some day
the images drop off the last bit, and the program uses a .DI format. However,
that aside, works great! At least worked great for me.

    Haven't used that since like 2000. I got a cheap 75 mhz laptop and ran the
dos based version of Steve Tucker's APE program.   But in a pinch, 800XLDJ does
alright.

   It's possble. The Falcon is a strange bird.

   But with all ST's I found that the "drver" program, or some serial port patch was needed since the ST had a few odd serial protocals. That is, you needed this patch to get the serial port working reliably at or beyond 9600 baud.

    A good question. I have run my SIO2PC cable at the end of the SIO chain.
I have run into problems only when I tried to add other devices that didn't
have another SIO port on it.. like the 410 tape player and some printer
interfaces.

    What I have and actually use are two different things these days.
Generally, as you can see, I call a lot of BBS's, and sometimes play a game or
two. :)

Note that for the switch to write mode in your disk write code:
```
(B83D)  LDA #$FF     ;(a) = sync byte.
        STA Q7H,X    ;Write 1 sync byte.
```
that STA abs,X (with no page crossing) is pretty much essential.
It syncs with the Woz Machine. You can't replace it with a STA abs.

This is covered in obscene detail in Sather's Understanding the Apple
II.

Just to expand on the double write issue, various 6502 ops
perform from 1 to 4 reads and writes to the given address.
Read-modify-write ops always perform two writes.
Read-modify-write,X ops perform two reads, two writes.

65C02 ops perform 1 to 3 reads and writes to the address,
and the read-modify-write ops only perform one write.

Ah, the Apple II. The more you look, the more there is.
It's like Natural Philosophy, or something. ;-)

Cheers,
Nick.

What machine (model) should I run it on? On the regular 48K it doesn't
want to load here

The 48K should be fine, other than missing out on the AY sound. What's
the problem?

In high-level languages, optimization is often necessary to allow
more efficient execution of natural expressions of algorithms.

For example, a loop counter may be kept in a register, even
though it is expressed as a variable (typically in memory).

Of course, if you like the compiler's unoptimized code, then you
can turn optimization off.

I had an Acorn 3000... it sucked.

I used the monitor for my Amiga 2000 though so it was good for something.

I get this feeling that everything that you didn't approve of sucked.

D.

No, I did use it for a while but in this country there was virtually no
support for it, that sucked. It didn't really do it for me, though the OS
did look good and was pretty fast.

No, I like plenty of older systems, like the TRS-80 for one. Amiga was my
main focus at the time, and it was a nice (Acorn) monitor.

Hm, is the regular BASIC LOAD "prgname" enough or is there a special way
of loading some prgs on the speccy like on the Ataris, you know... this

one with this and that one with that and the other one with something
yet else... ;-)

LOAD "" is the standard way used for 99% of Spectrum programs - if you
don't specify a program name, it'll load the first thing it encounters.
To get LOAD, just press J; " is symbol shift and P (ctrl+P or alt+P on
most emulators).

For demos that need 128K, the standard procedure is to select 128K
Basic, enter usr0 , then load as above.

Yes. That I still remember from 1985 when I had a Spectrum for a short
time ;-)

There is plenty of them out there.

I've still got mine though it's been boxed up for a while now since we are

renovating.

There are plenty of A1200's out there, so ofcourse more will be on sale then
Falcon's which are pretty rare by comparison.

If I came across a Falcon I would snap it up.

2. I have a bad OCR scan (yeah, I'm too lazy to clean it up) of the DDT
manual I'll send you.
3. If you want to cross-assemble, you might go with atasm or ca65 (or
others) to compile at PC speed. I also recommend dis6502
(www.sf.net/projects/dis6502) for cross-disassembling.

I would be quite happy to trade my A2000 and A500 for an A600. Only
downside is you can't play F1GP on a A600 IIRC. Doesn't matter though,
it was faster on an STFM.

Mark

The item got killed, but it is a 5200 only item. The cart will not
physically fit in an 800 slot.

Much faster on an A1200 or the A2000 I had at the time. It was a good game.
I enjoyed playing Wings, and Dune II as well, brilliant with the Supraturbo
28 accelerator I had, 28Mhz 68000 overclocked to 40Mhz A2000 :-)

I personally don't see the point of owning an A600 when A1200's are much
better, more common and it has plethora of expansion options available for
it.

Hmm you she see it on a 50Mhz Atari Falcon (CT2), runs like a cut cat.
Vroom too.

Items Missing:
  * Horse Gender
  * Source of Internal Injuries
Hypothesis:
  (He) was a male horse. Didn't particularly care fore being buggered,
and thus kicked the innards out of the camera guy.

Couple of life lessons for the kiddies:
  * Don't have sex with animals.
  * Don't have sex with animals of your gender
  * Don't offer to film anyone having sex with an animal
  * If you must film someone having sex with an animal,
     make sure that the money's good, you're paid in advance,
    and fer'goshsakes use the TELEPHOTO LENS.

Unless you like jails,fines,courtrooms, or don't like your innards.

Oh don't even go there.

Clockmeister doesn't understand questions at all.

...and if you really must...

* Always ensure the animal is smaller than yourself
* Check animal for powerful hooves, teeth, claws, venom etc before getting
your apparatus out

Finally, make sure the animal is large enough that it won't split on the
first thrust.

It's at this point that sheep look promising...

| If you quantify then you could ask:

I agree with your line of questioning. However:

| Q. Can the Spectrum draw as many sprites as a C64 can at the same speed?
| A. The answer is yes regardless of how it does it.

This conclusion I'd like you to explain. The C64 can display more than 100
sprites moving on top of other bitmapped graphics, without the CPU having
to do anything else than setting the x/y position and data pointers. On the
Spectrum, the CPU will have to a) either redraw the complete background each
frame, or create a copy of the background image under the area where each
"sprite" is to be drawn, and b) draw the sprites above or below the background
image and perform the appropriate masking.

Somehow I don't think the CPU of the Spectrum will be able to do all this
with a scrolling background and lots and lots of sprites. I will ofcourse be
convinced if you send me a link to a game or demo that does all this, and
a link to an emulator I can use to see it in action.

Here's another question for you:

Q. Can the Spectrum use sprite colours that are separate from the colours
   used in the background image, without any form of colour bleeding?

You've gotta be shitting me? How can a crappy machine with only a 68020
keep up with a 68030 and a 56001? Its like comparing a Holden Camira to
GTR Godzilla Skyline. As far as the STE goes I have seen several demo's
that easily rival the A500, both machines are very close in terms of raw
horsepower, but comparing a Falcon030 to an A1200? Especially after
carrying on about custom chips. The DSP in the Falcon alone is good for
around 16mips. And being that it is fully programmable, it can be used
for just about anything (giving a total of 20 mips for the Falcon
WITHOUT a 68882). Bizarre. Although, if you concede that the A1200 DOES
keep up with a Falcon (chuckle;-), then you have to concede that a STFM
CAN keep up with a A500, or a Speccy CAN keep up with a C64. Get a hold
of the Froggies over the fence demo, or the Sam Fox demo.......
thousands to choose from.

http://www.dhs.nu/
http://www.atari.st/ (click on Amiga;-)

Might sit down and play a few demos on the MegaSTE, thanks;-).

Mark

Too fast I imagine, there is a hack to slow it down on systems that are too
fast for the game, for Amiga anyway.

>> I personally don't see the point of owning an A600 when A1200's are much

MW> nice logos.

That just repeats the same 16x16 pattern across the screen, which is
hardly what Lars meanth. How about scrolling a full screen of actual,
meningful graphics, with some sprites on top? The end part of Demode
is a pretty good example, with an IFLI image (6 colours per 8x1 cell)
and 16 sprites on top:

  http://noname.c64.org/csdb/release/?id=15101

Of course, demos are all about cheating. How about an 8-way scrolling,
full screen, 50 fps game? Turrican II demonstrates it nicely:

PLEASE trim when quoting (and that goes to the rest of you overzealous
quoters too).

MB> You've gotta be shitting me? How can a crappy machine with only a
MB> 68020 keep up with a 68030 and a 56001?

Well, both machines have several architectural problems. The A1200 has
a 14 MHz 68020 on a 32-bit bus, but is bottlenecked in chip ram by the
custom chips (in fast ram it runs at full speed). The Falcon has a 16
MHz 68030 on a 16-bit bus, and as the 020 and 030 are about equal,
IIRC the A1200 is even a little bit faster. The 56001 is nice though,
and a general purpose coprocessor, as opposed to the Amiga's specia-
lized blitter and copper. Either way, the machines are definitely in
the same ballpark.

MB> Get a hold of the Froggies over the fence demo, or the Sam Fox
MB> demo....... thousands to choose from.

MB> http://www.dhs.nu/
MB> http://www.atari.st/ (click on Amiga;-)

New demos are always fun. What are the top 3 unaccelerated Falcon
demos? 060 stuff doesn't interest me, it just looks like crappy PC
demos...

Hmm, not arguing here, honest curiosity, but I thought the Falcon was 32
bit internally? Also, it does have a blitter chip as well.

I've asked this question before: name one demo that truly shows off the
capabilities of the Spectrum. Give it your best shot: which Spectrum
demo turns the faces of the CSC crowd green with envy?

Yes, but it is bottlenecked by the external bus.

 Also, it does have a blitter chip as well.

Agreed, they aren't inspiring at all. Still amazed by what the C64 can be

made to do some 20 odd years after it's introduction.

RJH> Hmm, not arguing here, honest curiosity, but I thought the Falcon
RJH> was 32 bit internally?

It sits on a 16-bit memory bus. It's still a 68030 CPU with full
32-bit registers and ALU, but the memory speed is halved.

RJH> Also, it does have a blitter chip as well.

Yes, but apparently it's quite slow. The first google hit for "Falcon
blitter" gives you:

  "Unfortunately, the Falcon Blitter is rather useless since the 68030
  is, when doing a simple 1:1 copy, about a factor of 4 to 5 faster
  than the Blitter in the Falcon is, even though the Falcon Blitter is
  running at 16 MHz. On the Falcon, the Blitter can become useful if
  you plan to heavily use Halftone-pattern, bitwise-shifts and logical
  operations. Otherwise, use the CPU instead."

Is that all you've got to say? That's wtice now you've said the same thing. I'm
still waiting for some answers to questions I posed to you some time ago.

Or have you run out of steam? You're really no good at arguing, are you?

Who needs demos? there are planty of games that can do that. Starglider, Carrier Command, Starstrike are just a couple of examples.

The Spectrum has hardware support for flashing things on the screen. I guess the "usefulness" of that feature was enough justification to limit the choice of the colors in an attribute cell to either two high brightness colors or two normal brightness colors.

Timing was better on the Atari, no hack neccesary. Major frame rate
improvement tho.

A6000 is smaller, and I already have a CD32.

> is also just a MOB.

No, by _your_ definition, not _mine_.

An MOB must be moved in memory in order for it to move on the screen, and the background beneath the MOB must be redrawn to avoid creating a hole in the background where the MOB was before being moved.

On a machine like the Spectrum, moving an MOB the same size as a C64 sprite smoothly from one side of the screen to the other side, all the while redrawing portions of the background as necessary, requires huge amounts of CPU cycles.

A sprite can be moved on the screen without moving it in memory, and is nondestructive to the background that it moves over.

A sprite on the C64 can move all over the screen without ever being moved in memory, and without affecting the bitmapped background beneath the sprite. The magic is done by the VIC chip (Video Interface Controller), and only a few clock cycles from the CPU are needed to instruct the VIC chip as to what it should do with the sprite.

The Spectrum just can't compete with the Commodore 64 because it isn't even in the same league!

Yup, my CT2 is actually 32 bit tho, one of the improvements by Rudolph Czuba. Interestingly enough, not alot of progs use the blitter, because the 68030 gets no real benefit. Also it cannot be overclocked, but because it is a part of the Videl chip, it cannot be removed. I run a little app on boot up that switches it off completely. Otherwise the screen garbles if it is enabled. Also, using NVDI or FVDI is a software blitter than is actually FASTER in operation than the hardware one.

How many mips is the A1200? 1.6? Not even close to the Falcon on its worst day, crippled or otherwise. A 68030+65001@16Mhz combo is always going to out do a 68020@14Mhz, especially after dropping a 68882 into the equation;-). Does the A1200 have a copro?

Again if you concede that the A1200 can be made to appear faster than a Falcon then the same can be said for the STFM v A500. And believe me I have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth scrolling even on a stock STFM, every bit as good as an A500. One demo I saw was having a crack at how badly Shadow of the Beast was coded (ported) to the ST. It had all the elements of what Psygnosis should have done. The bitmap brothers could do it.

Never bothered with PC demo's, plenty on the Falcon/TT/ST tho. The 800XL
is the same, and even the STFM is having MORE boundaries broken as time
goes on. You would think the demo coders would move on, but it isn't the
case.
Maybe we need to organise a Computer fest in Australia, Clocks? Pizza,
Beer and Atari's;-). And maybe a few Amiga's?

Mark

And I can give you this Answer the first time.

The Spectrum does not show its abilities by demos, it shows it by high
quality and High End Games. Of course!

I could say a dozen games.... I am sure you know them..

So the only thing you can use as a basis for comparison are games which
weren't ported to the C64?

Then you will excuse us for using demos that weren't ported to the ZX as our
example. Since the demo scene is about extracting what is possible out of
limited hardware, one can only assume that either the ZX had lousy coders or
the hardware sucked... which is it?

Quite a number are still coding ECS demos though AGA offers a lot more
scope.

It has nothing to do with the timing of the computers but the way it was
coded. I doubt the Atari version was any different.

A600's suck, really.

I've been following this thread for a while, thinking it was kind of
interesting (minus the name-calling). I'm a C64 fan, I've never even laid
eyes on a Spectrum before, so I took a look at the list of demo screenshots
for the Spectrum that you posted earlier. To my surprise, they all look
pretty terrible-- after all the strident arguing you've done I was shocked
at how poor looking they were. In fact, I have VIC-20 games and demos that
look as good.

So, I did a little googling, looking for some more Spectrum screenshots of
games I am familiar with; games that were also made for the C64. I found
shots of International Karate, Winter Games, Ghostbusters and a few others.
These games all look ridiculous compared to the C64 versions. Generally,
they all look like plain 2-color bitmaps. Just a foreground color and a
background color. Once again, I thought of the VIC-20 and how a fully RAM
expanded VIC could probably produce games that look almost as good as what
I've seen from the Spectrum so far.

One site I visited had some audio samples from Spectrum games. Yet again,

they seemed more in line (even inferior in some cases) with the sounds I've heard from VIC-20s. Comparing them to what a SID can produce is, well, like comparing a SID to the VIC.

Don't get me wrong, I totally understand being fanatical about your system of choice-- there's a lot of nostalgia wrapped up in this for all of us-- but it seems to me a Spectrum/VIC-20 comparison is more realistic than a Spectrum/C64 one.

Or is there something I'm missing? I'm eager to be educated. As several others have requested, I'd like to see some screenshots of what you consider the really great Spectrum games and demos. What I've seen so far tells me that your obvious love for the Spectrum has pretty seriously damaged your ability to be objective about it's abilities.

It must have been different, because I simply loaded the game on my
Falcon and bingo. Only Backwards was neccesary for OS patching, not
hardware patching.

But they are no different to an A500, bar the keyboard? Wasn't stunt car
racer an issue too (WB2)? We used to run an Atari Vs an Amiga using null
modem, great fun. Atari had the minor frame rate advantage.

Mark

Starglider is like Christmas, it comes around once a year but most people
are glad when it is over again.

Like you I have trawled through sites, watched the demos, listened to the
tunes and played the games. I have come to the same conclusions that you
have, the Spectrum is a limited little box a generation behind the C64.

To advocate the ZX over the C64, well I find it embarassing for them that
they can't see what is plainly obvious to anyone with eyes and ears.

I am auctioning some of my more unusual games this week, due to
financial circumstances. (such as my car getting ripped off...merry
christmas!) I rarely post auctions anymore but in this case I have some
very unusual stuff for auction and I would like to make sure some hard
core 8-bitters like myself are aware of it.

These games took me forever to find, and I have only seen one instance
of them ever, in all of my travels to classic game expos, talking to
collectors online, scouring Ebay in every country etc. These are both
near mint and complete, tested, and work great!

I think I can safely say you will never see these again on Ebay!

http://search.ebay.com/_W0QQsassZsatcom2QQhtZ-1

Thanks for looking and happy holidays!

I am still seeking an Atari 1200 XL Computer to begin my developments
on the Atari side of the forum. I am currently active in interfacing
and designs on most of the other "MAJOR" 8-Bit machines, but have a
STRONG DESIRE to get involved in the Atari' as well. If you have a 1200
XL for sale, trade, or donation, please contact me at:

shifty_butch@hotmail.com
or at (909) 854-1210

Thanks and

HAPPY HOLIDAYS!

Charles

cart. What kind of Eproms can I use? Can I use larger ones and just
duplicate the code like on other systems to make it work? What if I want to
use a 16k file? What all Eprom types can be used with these PCBs.

TIA,
TJ

I'd only being guessing so I won't do that.

I have noticed that some of my Atari cartridges are missing "fingers"
on the edge connectors. Don't know if would affect addressing of
larger ROM sizes since I don't know the pinouts.

There are some threads over at AtariAge.com about DIY cartridges plus
AtariAge sells blank cartridges which hold 27128 (16K) EPROMs. Pretty
cheap too. Certainly an easier starting point than hacking 24-pin
sockets.

Those older brown carts are more likely to contain masked roms than eproms,
and you cannot replace one with the other unless you make modifications to
the boards. As I understand, some of the later carts may have eprom
boards, but none of the brown ones I have opened have them. I recently
purchased cases and 16K boards (specifically for 2x2764 eproms) from B&C,
and they also carry the matching eproms. If you want to burn some games,
you might give that a shot.

Works great too. I have made some and have quite a few more
boards, cases and eproms to make some more. I think I got mine
from AtariMax, and plan to get some more. I've got a load of
cart files downloaded, but am so busy with my Apple II stuff
that I don't have the time or space to get Atari set up now.
Soon as I do, I'll be available to assist anyone who needs
help with their stuff. :o)

Where can I buy the parts to do that? I have a EPROM programer, all I need
is cases, boards and the chips I can find online. I checked Atarimax and
all they have are the Flash carts not what you mention.

Thanks that is exacty what I am looking for. I see that hey 2764 and 27128
EPROMS for the boards, but if I order the 27128 EPROMs and want to put a 8k
game on them can that be done? Or do I need to get a 2764?
Thanks
TJ

These guys have the boards.

http://www.atariage.com/store/index.php?
cPath=45&osCsid=aa09356132a48c5e88772919dbd732ef

Lots of cart files available here.

http://www.atarimania.com/lst_soft-MENU-8-TYPE_CODE-G-JEUX_ID--VERSION_ID--Page-1-
ADV-0-VERSION_CART-1.html

Also, Best Electronics has lots more, but you have to buy
their catalog as many of the items are not readily accessed
through their web pages. Looking for the link to their home
page.....

Here it is:

http://www.best-electronics-ca.com/

Good Luck.

Bill Garber

You can either insert a 2764 into the socket, or
double up the 8k file so that it burns onto the
lower and upper half of the 27128. Will work fine.

With the proper address lines switchable, you may
even be able to put one 8k game on the lower and
another 8k game on the upper and have 2 games in
one cart, using the 27128 eprom. :o) This is done
quite often for different firmware on interface
cards in the Apple II. The CFFA IDE card is one
example of this.

I don't really know I'm a newbie but AFAIK the 27128 simply has one
more address line. If worse came to worse couldn't you tie A13 to
ground thus limiting the cart to 8K.

Checkout the message threads at AtariAge. I'm pretty sure I read about
stuff like what you ask, as well as DIY multicarts, and banking
multiple games.

I'm actually just starting out myself with banked OS ROMs. I was
planning to piggyback an SRAM over an EPROM. The project is to be a
simplified version (at least in my imagination, LOL) of Bob Woolley's
SmartOS. I wanted to use a single selector switch instead of toggles
and drop the internal cartridge emulation and $D600, $D700 features. I
just want the software programmable OS feature and nothing else.

I just like the idea of software programmable stuff and non complicated
hardware mods.

I'm off to a bad start. My EPROMs don't even work in my 800XL and I
didn't even get to the stacking yet. LOL.

I told you I"m newbie.

LOL!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

An 800XL or 130XE would be a better choice. The 800XL is just about
the easiest machine to upgrade since most have socketed chips.

About the most popular interface is APE which allows a PC to emulate
normal disk drives.

http://www.atarimax.com has details, as well as flash memory, IDE and
USB interface cartridges.

That sounds great. It is alot better than what I paid for my Atari clone, the
Hades 060, which was some where around $3500. Still, it was worth it as it
still works and functions great for me today.

Bill that tune jizzy would not leave mah heezee until this

http://video.google.com/videoplay?docid=-3669401288596748795

The Atari thugz is well served n I found this bunch

http://video.google.com/videosearch?q=atari

Pole Position rocks.

Sinclair thugz only hizzy one advert but its cool ta drool.

http://video.google.com/videoplay?docid=4202568674798941434

C64 gets me three but poor in tha hood.

$3500 US?

Is it true that the MIDI timing is nothing like it was on the real Atari's
and there have been lots of compatibility problems or is that the Milan I'm
thinkling of?

All three of the ones I have DID NOT have socketed chips... I'd be
suprised if the majority of the 800XLs had sockets.

I desoldered all the main chips from one of my 800XLs and put sockets in.

Hi Shawn-

What was the origin (manufacturing site) of your 3 soldered XL's? My experience has been that Hong Kong XL's were socketed, and only the Taiwan XL's (the last major run of post-Tramiel XL's) were soldered. Many Taiwan XL's also had Rev. "C" BASIC.

-Larry

Yes, if you look at the pinouts of these chips (try www.chipdir.org)
you'll see that most of the pins match up, even between 24-pin chips and
28-pin chips. It makes exchanging one chip for another or stacking them
fairly easy.

Micheal how come the faq still does not reflect the additions (re ntsc
65xe wiuth ECI) that we discussed?   Just wondering how long it takes
to update the faq (both the august and oct additions dont include this
info)

Thanks
Kevin

Heh Heh

I believe that the original poster, my old friend
Osama Bin Laden (Micro Penis) would have wanted us to use these links

http://atari.istheshit.net/

http://c64.istheshit.net/

http://spectrum.istheshit.net/

http://xbox+360.istheshit.net/

Spectrum wins :-)

   I wonder in the ARM series if the Newton 120 or 130 could compare?   Those were fairly good, though it was like using a palm sized Macintosh Plus.

    David Acklam, once he had his Hades back frm the world tour it had, was very happy with his too. I wouldn't have minded a 060 Milan... but then again, in the end I came to realize that the Mac was my best current world solution, and stuck with that.

Hello,

Thomas, Harry and me have been hiding in Frankfurt last weekend for an
day-and-night USB coding workout. Only living from bean-soup (Harry, this
was great!) and christmas cookies, we created a lot of new USB code:

* Harry has extended the SIO2USB Utility driver

* Thomas has been working
on routines to read the directory structures on a FAT 16 formatted USB
Stick

* I have added USB Storage routines to the USB Test program. We can
now access some USB Sticks and can read and write sectors. In our case the
Apple iPod Shuffle was working (Who will volunteer to write iTunes for
AtariXL ??)

The new USB Test Program will be available during the next days on
Sourceforge and on the MicroUSB Project pages.

We made some pictures:
http://www.strotmann.de/twiki/bin/view/Mic...jUSBConvFivePic

Best whishes from the ABBUC RAF USB Team!

Carsten

>info)

The FAQ gets auto-posted here in the newsgroup every 60 days. Each time it
gets posted here, the web mirrors in turn automatically update with the
version that appears here.

I updated my working copy of the FAQ with the NTSC/65XE/ECI info from you on

9/5. The FAQ was next auto-posted on about 10/25. Unfortunately, I had neglected to upload a new copy of the FAQ to the auto-poster since the previous posting, so the version that appeared here and was mirrored on the web on around 10/25 was actually the version that I last revised on 8/15. So that's why the info from you isn't there yet.

The FAQ is next scheduled to auto-post on around 12/25 (merry Christmas!), 60 days after the last one. I've already fed the auto-poster with newer versions a couple times since 10/25, so it will definitely include the info from you, along with a number of other updates. In fact, here's a little "preview":

UPDATES SINCE PREVIOUS POSTING
2005.11.27 8.1 updated to revision 2.0, 2005-2-20 from Freddy Offenga
2005.11.27 7.1 updated to Version 3.4, 2005-11-26 from Freddy Offenga
2005.11.27 6.8 The Entertainer variations, thanks Bill Demian
2005.11.16 1.11 added custom IC part numbers from Best Electronics catalog
2005.11.14 1.11 added link to http://www.retromicro.com/, thanks Kryten
2005.11.08 2.1 More Than Games link updated
2005.10.28 1.11 datasheets & schematics missing from revised atarimuseum.com
2005.10.15 11.2 1.2 1.3 3.4 800/810/400 production ended May 1983
2005.09.09 3.9 added SIO2Linux, by Preston Crow
2005.09.05 1.7,1.12 some NTSC 65XE's include the ECI port, thanks Kevin
2005.08.26 11.2 JAKKS Pacific and Atari Flashback annoucements added
2005.08.15 11.2 1983 1200XL, 800 retail prices

Thanks,

-Michael

If you have the equipment and know-how to make your own PCBs I can send
you the plans for the 27128 EPROM Cartridge. I have made several for my
800XL and swap the games/utilities on them regularly. You don't have to
fill the EPROM so a 27128 EPROM can take a 4K / 8K or 16K program
without any modifications. Let me know if you want the plans...

Or he could spend $5 to $8.50 and get one already made...

I notice that XF551 uses IBM style 360K drive. I wonder if the XF551 works
with any IBM 360K drive compatible like Teac, Toshiba, Mitsubishi, or
Mitsumi?

Jack

Yes, it does. I think the only limitation is the power that the motor requires.
In fact, I think they were TEAC mechanisms fitted into the XF-551 casing...
But right now I don't want to open my XF-551s to verify it...

Yes David is still very happy with his Hades as far as I know. You are correct
about the Mac. If anything seriously happened to my Hades I would probably get
one if I had no other options.

Yes $3500 US. AS far as MIDI goes, it works fine on the Hades. I use the
program Sweet 16 and it seems to run fine.

    Guys i'm sure this is an easy one, but I can't work it out in my head.

I've got the MyIDE 3.1 External device with O/S chip installed. Running
Sparta3.3 for MyIDE. Ran a program that clobbered D1. Wanting to reformat
D1 but can't remember the sequence. Any help is appreciated!

Thomas

I tried using the Teac "IBM Style" drive in XF551. The power cable is
connected from AT Power Supply. I do not use the power from XF551 circuit.
When I turn on the computer, the motor in the disk drive is running but
there is no busy light and the Atari Single/Double Density disk can not be
read. I think the most mechanisms do not work with XF551. I think the
special mechanism is designed for Atari XF551. Like the oldest disk drive
from VAX microframe work with IBM AT but DOS formatted disk can not be read.
Oh well...

IIRC, the XF551 mechanisms were made by Mitsumi, and there was something
special about them. For the life of me, I can't remember what...

Been forever but...

Not only is the standard drive a low powered one, it is also jumpered
differently then an IBM style drive. Remember how the IBM used a
cut/twisted cable? I think that was so both drives could be jumpered as
D1: for an XF551 I'm pretty sure you have to jumper it as D0:

Hi Guys-
Good to hear from you Marco!

I've used several "modern" 360K drives in the XF551 case. I've also
seen a HD 1.2 mechanism installed, but naturally ran as a sort-of 360K.
 Atari also used more than one brand of drive. Jumpering *is* an issue.
 IIRC, my stock Mitsumi had to be jumpered as device 1 rather than
device 0 for it to be D1: in the system. The other issue that pretty
much always comes up is that the 34-pin connecting cable is too short,
since most drives connect on the opposite side from the stock mech.
But easy to lengthen with an adapter cable. But when its all said and
done, IMO the best use of a 551 is with a 720K mech. Twice the
storage, no/fewer compatability issues, very low power requirements.
Of course, that may not meet your needs. Incidently, look into
HyperXF. -Larry

The TRAK model you mention is single-sided, so no. Not unless you have
a modded 551 (or use "flippy" disks with 2 timing holes in the
jacket.) In that case, you would be using the 551 to write
double-sided 90 or 180K disks. Astra did produce some 360K models, but
I *believe* they did not use the same format pattern as the 551. The
FAQ's might have some info on this. -Larry

Hello,

the new USBTEST Version 0.6 disk is online at SourceForge
http://sourceforge.net/project/showfiles.php?group_id=111428

New features:
* Get Descriptor Routines and Display are now working with more USB 2.0
devices

* faster Routines to move data in/out of the USB Controller
buffer, using Cypres SL811 autoincrement

* USB Storage Sub-Menu

* Function to send SCSI Device Inquiry

* Function to read SCSI Device
Capacity

* Function to read SCSI LBA (Sector)

We would like all owners of an Atari USB Cartridge to test USB Sticks and
Harddrives with this new release, so that we get an Idea how good the
current code is.

Please test and send us information:
1) if the device can be attached
2) if the device descriptor page can be retrieved

3) if the Device Strings

are printed

4) if you can access the device in the SCSI menu. For this you might need
to adjust the endpoint numbers for the in/out endpoints. You can get this
information on Linux using the "lsusb -v" (from usbtools) command to
display the descriptors of all attached USB devices (on windows you can
use USBCheck.exe). In the next version of the tool I will implement
reading the configuration descriptors and setting the correct endpoints.

I will collect all this information and will post the result on the Atari
USB Device Driver Matrix Page:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartAtariDevMatrix

Best regards

Carsten

That's correct. I have a Big D with one DSDD drive in it (the other one is
SSDD). The disks are not compatible with the DSDD XF-551 disks.

While I'm a diehard user of the original equipment, I wanted to give an
emulator a whirl, mainly to see what kind of speeds I get out of Mac65.

I chose the Atari800 emu for Linux, but I'm having great difficulty finding
the OS & BASIC roms. I found some BASIC roms, but I have no clue if they'll
work or not until I get the OS.

Do any of you guys have the roms or know where I can get my hands on them?

Thanks,

Xref: g2news1.google.com comp.sys.atari.8bit:3738

Many disk drives have 3 ways to read the other side of disk.

Number one is XF551 reads the 1st track to 40th track on first side, then
reads 40th track back to 1st track on other side.

Number two is like 1571 method, (CP/M), the drive reads the 1st track to
40th track, then the head moves back to 1st track as Number 41 track, reads
1st track to 40th track on second side as Number 41 track to number 80
track...

Last is Today's PC disk drive reads 1st track on upside then downside, next
track on upside then downside. so on....

I am curious... Which method does Trak AT-D4 use?
Astra the One ???
Astra Big D ???
Concorde C-222M ???
Percom RFD44-S1 ???

Do you know?

Thanks!
Jack

Actually, you can use a modern PC for that. I saw a website once (tried to find the link, but alas, I couldn't) where it showed 10 things to do with that old PC. There was the fish tank, the hamster cage, etc. But my favorite one was where a guy had the side off of it, sitting on a stump and filled with charcoal while bar-b-que'ing shish-ka-bab's over the fire. I laughed my butt off when I saw that. I mean, I work in a computer store and everyday people bring in these old computers (IE: 486, pentium 75, etc..) and ask me "what can I do with this?" I'll usually roll off quite a few uses like "Well, you can use it as a door stop, or a boat anchor, or put it behind the tire of your car when you're changing the oil, use it for a step stool, or a camping chair, target practice with your REAL gun, a foot stool in the living room, a night-stand, the larger ones can make good coffee tables, etc.." I can go on for like an hour with uses for an old computer.. People just stare at my like I'm nuts. Then they will sort of insinuate that they are wanting to use it for some kind of computer related task like running Office XP or something. So I tell them, "Oh.. its no good as a computer, but it can doo all those other things." But now I also get to mention that it can be a bar-b-que grill or a hamster cage, and stuff like that.

Um, ok, your opinion. Why post it here? And why cross-post? Is this
another try at making a huge thread that makes no sense at all?

> Do any of you guys have the roms or know where I can get my hands on them?

You won't need ROMs for the atari++ emulator for Linux. See:

http://www.math.tu-berlin.de/~thor/atari++/

Greetings,
     Thomas

Because Paul Panks is a kook, as most of comp.sys.cbm can attest.

I've been posting in comp.sys.cbm since 1995. Only 3-4 posts that I've made in 10 years fall under those "kooky" guidelines. The rest are CBM related. Google it up if you don't believe me. Search from 1995 to 2005.

Paul

I can imagine. Do any of his posts relate to adventure games, in particular
trying to beg someone to do a C64 port of his adventure?

D.

Hmmm. Slick. Probably give that a whirl tomorrow after I get home from work.

I downloaded the roms and A800 nearly drove me insane trying to figure out the path for them. So I thought I'd give the windows version a spin. After examining the cfg file for the windows version, I realized that I had to point it at the directory AND the filenames for each individual rom for it to work, not just the directory. Nice tidbit of information to exclude...

Anyways, so far I'm not that impressed by the A800 emu, and I would vastly prefer using my real machine where I have a real Atari keyboard to use, if you wanna call the XE KB a "real" one... I guess it's a good emu if you don't have a genuine machine, but for the hassle of screwing with it anytime I wanna enable/diable BASIC and the various other options it has.

Maybe I just havn't found the setting for it yet, but A800 doesn't seem to be able to run any faster than a genuine 6502.

And the joy I get out of using the exact same computer I have had since I was 5, only pimped to the extreme with a 19" VGA monitor, hard drive, and a buttload of hardware my parents could never afford just has a level of coolness an emu can never match.

I see one very good use for it so far. Using it to test compatibility with the other Atari's. I don't feel like digging out my Dad's old 800 he bought before I was born just to debug a program.

What are my options for a Linux or Windows based 6502 assembler? The Mac65 assembler is great, but just too darn slow for those massive programs.

Thanks guys, just another obsessive Atari user who enjoys using a computer that's as old as I am. :)

It is puzzling why comp.sys.atari.8bit keeps getting dragged into this.
The commode users are in denial and keep starting these threads because of
their insecurity.
(note: the threads over the past months were both started by non-css-ers)

Ships eh?

>3. Thousands upon thousands of programs.

I have thousands upon thousands for other computers too.

>4. BBSs.

Yes, and? The Spectrum had them too.

>5. The most popular computer of all time.

"Popular" in what way? Also, "popular" != "better. Look at EA's console
games for proof of this.

Hi everyone,

Thought I'd stop being a lurker for a bit.

Been an Atari user since 1982, and I've recently had to go
full-emulation due to a couple of dead Ataris, (an upgraded 800XL and a
1200XL). Well, at least until I have more money...giftmas is eeeevil.

It's always nice to see another emulator that runs under Linux. I'll
compile it after work today. :-D

I'm currently running the atari800 emulator which has a debian package
for the kubuntu distro I'm using. The atari++ emulator looks like it has
many of the same compile requirements.

The best thing about running an SDL-based emulator under Linux is that
when if/when it croaks the operating system just shrugs, you kill the
app and try again. For Windows...eh, not so nice.

For those who are familiar with keyboard issues...
I've been running into problems with remapping the emulator keyboard to
permit keychords like the Action! "shift-ctl-M" and "shift-ctrl-E".
Running the Action cart without those keychords is just not possible.
Anybody get this right yet? Please share your wisdom, a link to an FAQ
I've somehow missed.

Worst case scenario, the "Linux Finger" solves all problems.
alt+ctrl+backspace and presto, you're back at the display manager login and
whatever nastiness caused the cock up is gone!

Lol. That was one of my next issues to address with A800. I havn't gotten
far with it yet, but I was getting annoyed trying to map out my keys.

One thing I've never truly understood is this: if the C64 was so popular,
then why is the C64 retroscene so different in character to the Speccy
retroscene?

Vague question, I know, but still...

Hi,

> Maybe I just havn't found the setting for it yet, but A800 doesn't seem to
> be able to run any faster than a genuine 6502.

I think it has a switch for allowing it to run faster, so does have
atari++.

> What are my options for a Linux or Windows based 6502 assembler? The Mac65
> assembler is great, but just too darn slow for those massive programs.

My recommendation would be the ca65 assembler, part of the cc65 C compiler.

You should find it easily when googling.

So long,
     Thomas

If you are already familiar with the Mac/65 assembler, I'd recommend
using ATasm. The syntax is Mac/65 compatible and it's available as
a precompiled .exe for Windows and also in source code.

I've been using ATasm under Linux for all of my Atari-projects for
quite some time now and it works very fine.

so long,

Hias

Do you mean as in not nearly as advanced in the retro scene? I know that sounds
like a flamebait comment, but I do look at the C64 retro scene, and it's tiny in
comparison.

No, because he writes his stuff natively for the 64, but he's done it in
comp.sys.apple2 before.

I mean you have not the slightest idea what's selling. The customers
you write about may think they are in a dream-store, after telling them
the uses for a 486. They only tried to check if you are even willing to
advise something useful. ;-)

I know 486 User in the Usenet and have refreshing conversation with....

Well, P75. I would suggest Win95 and Office 97. Not to mention the plenty of (pssst abandon..) DOS Software. Dear Sir/Mam you should at least keep your Door-Stop for such purposes. etc etc... and make one over that and say: But don't forget your P75 may be too fast for some games, though Office and Co. makes no problem... but only office 95 or 97 (97 I would suggest you as it is still used by offices and can read MS Office-files) ... after that he/she can get interest for a faster machine capable to drive XP and OfficeXP. But the possibility is always real, that he/she wanted no new computer at all, this time. But after telling about Door-Stopps, Anker, Baerbque-Grill and Hamster-Cage I don't think that you will see this customer, in the same store, again.

Use you fantasy for interest and not for making something bad. At least for selling more... :-) well? Right enough?

> 1. Best selling computer of all time.
The Windows PC. But I think we can all agree that it's rubbish.

> 2. VIC-II/SID chip.
Can be approximated an AY chip equipped Spectrum by using the Z80 to
add extra square waves to the standard sound channels. I suspect this
would be even easier on the Atari.

> 3. Thousands upon thousands of programs.
There are more programs for the Spectrum. I don't know about the Atari.
I do know that most of these programs (on all formats) are absolutely
god-awful. It's the gems that we remeber fondly, and there were
probably about the same number of those on all formats (including the
BBC micro).

> 4. BBSs.
As has already been mentioned this is not a feature of the C64. Just
like the internet, BBSes were platform independent. Perhaps the poster
is refering to the large amount of C64 software that was available for
illegal download. The availablity of this software and the willingness
of people to break the law may account for the popularity of the C64.
It certainly accounts for the popularity of the Windows PC.

> 5. The most popular computer of all time.
This would be refering to the Guinness book of records entry I suppose.

That entry simply refers to the fact that the bog-standard C64 had the biggest production run of any computer ever. So what? The bog-standard VW Beetle had the biggest production run of any car ever. I doubt many would argue that the VW Beetle was the greatest car of all time, although granted some enthusiasts probably would.

In the last cross-platform thread I asked what happened to the cross-platform development of a side scrolling shooter that was being written for the C64, Vic20 and Atari. I didn't get an answer. Does anyone know what happened to it?

On the subject of cross platform development. Someone mentioned that the C64 has an 8x1 attribute mode but I forgot the resolution. Is there a similar mode on the Atari? I should probably cross post this to comp.sys.amstrad.8bit as well because I don't know if the CPC has this mode. The reason is I'm working on a game for the Spectrum SE and I'd need some help. No one in the Speccy community seems to have the time, but if it became a cross-platform development there might be a bit more interest. It's not going to be processor intensive so it should be do-able on any 8-bit platform with a disk drive (or sufficient memory for a tape load). Would probably look at selling it through Cronosoft. Obviously the Spectrum SE version will be useable on emulators only (since there's still only one in existence). Drop me an email if any programmers amongst you are interested (that includes anyone prepared to work on the Speccy version). All I can say at this point is it's a top-down RPG.

14. spi...@freenet.co.uk
     Dec 16, 2:34 am

dun...@yahoo.com did eloquently scribble:

> 1. Best selling computer of all time.

Best selling computer of all time of one model of computer. IBM PCs
have sold more as a whole but not the PC, XT, At etc as a single model
with consistent specs has outsold the Commodore 64.

> 2. VIC-II/SID ship.

Back in 1982 a sythesiser was something no other computer had. And it
took years for the PC with it's internal beep speaker to get a quality
sound card to rival the 64.

> 3. Thousands upon thousands of programs.

-Big deal, so what?

Choice, variety. There were programs for just about everything on the
Commodore 64, accounting, word processing, etc. There are now web
browsers for it.

> 4. BBSs.
-Yes, yes, still nothing special
To many they were it was a great community if you ever were there.

> 5. The most popular computer of all time.
-Hah!

a)see #1
b)search for Commodore 64 on Google and see how popular it is.

Action! is the language of choice for me. Back in the day, it was the only A8 compiler that was fast enough to be tolerable plus it used a simple syntax (I can't comprehend C) and the performance was good too.

I noticed from one of your other posts you are trying the Windows version of Atari800. Might I suggest Atari800Win Plus version 4 (see link). I love this emulator for use with Action!. You can map the CTRL-arrow combinations to just the arrow keys. CTRL-Shift-up/down arrow (Action page up/down for those who don't know) becomes Shift up/down arrow and CTRL-Shift- R/T/M work as expected.

One problem. This emulator does not work properly with the combination of Action! and SpartaDOS. The key repeat feature goes haywire. I prefer MyDOS so this isn't much of an issue but If I do need to produce SpartaDOS disks/images I boot Bewe-DOS instead of SpartaDOS..

The H:drive of Atari800Win Plus allows you to use your PC hard drive and this feature works well with Action! but I do wish the virtual H: drive could be mapped to D1:...D8: for compatibility and transportability of my Action! code (e.g. I have to change my H1: references in my Include statements to Dx: references so I can compile my code on the 800XL) . Using H6: thru H9: make it easy to import ASCII sources, just drop them into the appropriate folder, but Atari800Win Plus expects lines terminated with LF (line feed) only ala Linux. It doesn't tolerate the CR/LF combo which always appear when cutting & pasting from a webpage.

Game controller options are quite flexible but I just don't like analog joysticks with A8 games. Off-topic, but I much prefer the old, digital game pads for most games while the ultimate, old-time enjoyment can be had using the DIY PPJOY (parallel port/joystick) for Atari type

joysticks. I hear Stelladapter (something like that) is quite good as well.

Looking ahead to a couple of your other posts...

Can't help you with cross assembler recommendations. Assembler and Linux are two other things the my little brain doesn't quite comprehend. LOL!

Your dad purchased an 800 around the time you were born! Yikes! I feel old!

When I purchased my 800 (in 1979) I put off replacing my first car (of one year) for just a little longer. That first car cost me $800 (a well used '72 Plymouth). That 800 (with 24K of memory) was $749 (discounted, new). The car is long gone but I still have the 800 and it still works and I still love it. It has the best A8 keyboard (IMO).

Steve Sheppard

> Use you fantasy for interest and not for making something bad. At least
> for selling more... :-) well? Right enough?
>

Well, what you don't understand is that I work in the service department.
So I'm not out selling computers. These people are bringing in their
computers wanting them to be repaired. They often picked them up non-
working at garage sales for $5 and stuff and think they're going to get
them repaired for $10 and have a perfectly working computer. They have
every intention of having us install Windows XP (which they believe is
free, they just have to pay us to put it on there, yeah right.) So once
I tell them that all the upgrades to make their computer XP compatible
(parts and label) end up being around $400 and XP itself costs $149, so
they are lookinng at an upgrade cost of $450 or so.. then I explain that
they can actually BUY one of our brand-new Dell systems or a slightly
used system with XP already on it for like $250, then it suddenly makes
more sense.

Yes, I perfectly understand that an old computer can be used online. I
myself use a laptop computer which is a Pentium 133 quite often (although
my computer on my desk is 2.53 ghz because I have to do video editing) My
133 laptop runs Windows NT 4.0 and I run a variety of programs on in
which are older or use low memory. If I didn't need to do video editing,
I could use it as my main computer. But the difference is that I
understand what can and cannot run properly on a Pentium 133. I also
know how to keep all the programs out of my startup group and I know how
to keep spyware and viruses off so that it runs fast. But most people
don't. You hand them a Pentium 133 and they will want Windows XP and
Office XP and 200 pieces of spyware and everything to be in their startup
group and the system will take 20 minutes to boot to the desktop and they
will complain that it is slow.

The big deal, so what implied that there's nothing special about "thousands upon thousands of programs"
Cos there isn't. The spectrum also has that.

>> 4. BBSs.
> -Yes, yes, still nothing special
> To many they were it was a great community if you ever were there.

The spectrum had that too, hence the "nothing special"

>> 5. The most popular computer of all time.

Every Windows User is a good User. Economical seen.

To even think about if people are paying for Windows or not dazzles my brain. If I want make money out of something, and with something software, then I pay for it (ie. OfficeXP2002 and making invoices with it). Windows I have bought by other reasons, though I don't need 2,53GHz for it :-). My 96' Chipset is fullfilling any Quest and Windows XP Sp2 fits perfectly to the hardware I mentioned. It fits even better than NTo4 (i used Too on it, NO AGP texturing, NO DX <3), though you need some MHz more, indeed. I would say a fast 300-400MHz CPU can do XP. A good chipset preconditioned.

Although I do not pay only to MS. Any honourable Software Developer..

Best Regards,

Daniel Mandic

I've had my BASIC cartridge forever (since 1979) and I've always
wondered about the signifcance of the numbers stamped on the face. Are
they a serial number?

My numbers are "R 40 2".

What about the framerate?

Again (changing the nouns to verbs):

- display multiple, 1:1 frame synchronised, perfectly smooth moving sprites
- present smooth 1:1 frame synchronised scrolling of the text and gfx
- render more than two colours in in one 8x8 pixel chunk
- play music rather than beeps ;-)

etc., etc.

And with that I do believe we have examined the strengths and weakness
of each machine. I will say this though, if you know what you are doing
there is stuff all difference between the two. For me I prefer Gem, all
that comes down to, is preferance.

I take it you have never seen an STE, TT or Falcon Demo? They have no
trouble keeping up with an A500 or A1200.

| What about the framerate?

Show me an example of a Spectrum game (or demo) with smooth scrolling (vertical
or horizontal) full screen graphics, and 30 or more sprites moving individually
on top, all running at 50 fps.

I did fit a overscan circuit which consisted of 2 ic's and a driver. It
worked well. I never got into video editing. I did do some on a friends
Falcon, it was able to do 16bit. And 1024x768 on a VGA monitor.

Mark.

| Interesting... if you're not trolling I may select some sprite-heavy
| demos of the eighties for your perusal.

Load this part (from a demo released in 1991) into VICE:
http://www.larshaugseth.com/mplx.prg

Let's see something like that on a Speccy.

Larry. I'd be glad to give you my little BASIC program I call
splook.bas. It is little more than a raw sector reader, and quite a ways
from being a directory lister, and not at all a file copier. I'll send it.
Sparta/FTe has the location of the first directory sector map in the
boot sector 1, 23 byte records for each file. Then you go to the
sector map of the file. The first two bytes the next sector map, zero
if last map, second two bytes previous sector map sector. Oh,
well, I'll send it. It uses abbreviation of First Sector Map, FSM.

The closest I can think of off the top of my head is part 3 of NMI 3:
http://www.zxdemo.org/item.php?id=3042
Unfortunately that only scrolls two thirds of the screen, so you'll have
to trust me that it *could* have been done full-screen, except then we'd
lose the nice logos.

Less than the cost of an Amiga + a sound card. :-)

Whoops! This thread did get badly sidetracked didn't it?

As a doorstop, the Spectrum wins hands down... or rubber keyboard down... as
the case may be.

How did the X-Box get into this? It isn't even an 8-bitter.

In hardware? Without using Z80 clock cycles?

The VIC chip in the C64 can move sprites around on the screen _without_ any
help from the 6510. The main processor can be busy doing something else
while sprites move.

Here is at least a partial list, copied from another thread in comp.sys.cbm

A Mind Forever Voyaging
Bureaucracy
Beyond Zork
Hitchhikers Guide to the Galaxy (Solid Gold Re-Release)
Kikstart 128
Last V8 128
Maidstone Quest
Nord & Bert Couldn't Make Heads or Tails
Rocky Horror Show
Sherlock: The Riddle of the Crown Jewels
Space Pirates 128
Starship Battles 128
Thai Boxing 128
Trinity
Ultima V
Zork I (Solid Gold Re-Release)
Zork the Undiscovered Underground

I don't deal in warez... I'm funny like that. So, I don't have any download
URL's, but a little searching should turn up cracked copies of some of the
above games.

>> (8K ROM; this one is not completely decoded and can only hold 8K), and
>> the DOCK bank which is empty and is reserved for cartridges. The memory
>> is bankswitched in 8K chunks
>
> No sense...

Not to mention the fact that it's untrue; A stock C64 holds 64K RAM, 4K
character ROM, 8K Basic, 8K Kernal ROM - cartridges have another 8K to
their disposal, and some I/O addresses too. So, that sums up to 84K.

Hey, I might get nitpicky, and include the Colour RAM: 1024 memory locations,
of which only the lower 4 bits are actually used, but then I'd have to
compensate for the fact that $0000 and $0001 are actually I/O, and that the
underlying RAM isn't particulary easy to access. Either way:

YOU LOSE.

Bank switching is much more elegant, too. The lower 32 KB of memory
($0000-$7fff) always holds RAM - at least from the CPU's point of view.
The next 8K ($8000-$9fff) usually holds RAM, except when a ROM cartridge
is inserted. $a000-$bfff holds either the BASIC interpreter, or RAM
(Selectable with an internal I/O port). $c000-$cfff is always RAM (and
not in use by BASIC, so it's a convenient location to store your machine
language gimmicks). $d000-$dfff holds either RAM, the character generator
ROM, or the I/O area (The 6502 doesn't suffer from the wicked concept of
a seperate I/O memory space). Out of this I/O range, 2 banks of 256 bytes
each are mapped out and available on the expansion port for use by external
devices. The last 8K of memory ($e000 - $ffff) is either RAM or (kernal)
ROM, once again selectable with an I/O port.

The fact that there's "RAM under ROM" is very convenient, too; when ROM has
been selected for a particular area, all writes will go to the RAM. This means
that you can easily copy the ROM to the RAM, make some alterations, and
switch over. This was a commonly used technique to make OS changes.

So once again: You lose.

>> DMA support and memory bankswitching.

The C64 had bank switching (See above), and it did feature DMA support, too.
This DMA support was even used to add additional CPU's to the system. There
was a CP/M cartridge available which included a (severely underclocked) Z80
which could take over the bus. the Commodore memory expansion kits did their
transfer over DMA.

Gah! Again I state! I not comparing hardware. I'm comparing ability of each
machine - WHAT THEY CAN DO - regardless of hardware.

The C64 has sprites... so does the spectrum. Hardware or not.

Do you understand now?

> I'm not impressed.

That is not the most impressive C64 demo indeed. Demo's like Deus Ex
Machina do a much better job of showing the true capabilities of the
C64. I have yet to see a ZX Spectrum demo or game that is graphics- and
sound-wise impressive compared to C64 standards.

| That is not the most impressive C64 demo indeed. Demo's like Deus Ex
| Machina do a much better job of showing the true capabilities of the

| C64.

That was just an example (and an old one at that) of what you can do with
hardware sprites.

After the insightful posts from Peter, he only confirms my thoughts that you are
indeed just trolling for arguments, and haven't actually shown any evidence to
back up any claims that the C64 can do more than the spectrum.

Spectrum games and demos look like they are a whole generation behind the C64.

You want me to argue with you when all you want to do is dumb it down to
which computers produces the nicest looking letters on screen.

It is all about the hardware, like I said produce a demo that matches
anything like what a stock C64 can do easily and we can discuss further.

I'm not a coder, but I have eyes.

Well use them then! Repeatedly I've asked for al ist of things a C64 can do that
a Speccy can't, and all you can do is refer to hardware. I'm not talking
hardware. You've only come up with one thing so far - resolution - but nothing
else.

You've lost the argument on attributes, sprites, sound and just about everything
else, so what else have you got?

I've recently gotten back into 8-bit programming, and I've decided to
start learning 6502 assembly. atariarchives.org has several books

online which I've been reading through, and I'm starting to get a good basic understanding of how the 6502 works (I can add 2 numbers, as long as the result is less than 255 :P). I've been trying out examples using Mac/65. I've found both a cartridge image and a disk image for Mac/65. The cart is version 1.01, and includes the DDT debugger. The disk image filename is M65V42, and it's the one FTe released as shareware for use with XFormer. This disk doesn't seem to have a debugger (or I don't know how to access it). I've been reading through Atari Roots on atariarchives.org as a tutorial. This book is mainly written for an older Mac/65 disk version, which included the Bug/65 debugger (which I do not have). The book has a nice chapter on using this debugger. I thought about contacting Mike at FTe, but I gather from other posts that he is MIA.

I'm looking for 3 things. First, does anybody have a text file or a manual which describes the operation of DDT? If I just had a list of the commands, I could use DDT. Second, does anybody know where I might find a copy of Bug/65? I got my two Mac/65 images from the CTH archive, but I haven't come across any debuggers at all in this archive. Of course, the files have no descriptions. Third, does anybody have any tips for other directions I might go? I haven't really tried any other assemblers.

Thanks guys!

-Tom Rosso

You can't compete on the level the C64 is playing at. You can't play SID's like their supposed to sound, you don't ahev hardware sprites that blitz anything the Spectrum can come up with, you don't have demos that leave anything you can come up with in the dust. I'm glad you are happy with your boring, colourless uninspiring little calculator, but it doesn't cut the mustard in my book.

As much as you wish it to be different, it isn't.

And a good job too - you're definitely a lot more argumentative than anyone else in this discussion. I think that you should spend some time actually watching some demos before you pass judgement - but you won't, because it's obvious from your "tone" that you find the Speccy offensive (else you wouldn't have wasted so much effort defending your C64) and as such you'll just sit there secure in your own opinion without having any shred of evidence to prove your point - you've played with a C64 and seen it's demos, and you've looked at some screens from a speccy. Hardly a comparison.

You come across as a whining bigot most of the time. The only thing that prevents you from becoming classified as a troll is that you respond to people's replies. But that's the only thing.

And it's rather amusing watching Starglider winding you up - you've bitten every time.

D.

Typical reaction from you...

"Ooh! Ooh! Our hardware sprites! Ooh! Ooh! The SID chip!".

Still having to rely on hardware to try to prove your point.

I'm still waiting for this almighty list to show what the C64 can do that the speccy can't.

I'll tell you why you're not answering it...

...because you can't actually think of one thing it can do more than the Spectrum.

Sad, sad little man.

They always do. They must really be gluttons for punishment to continue
their silly claims that the Spectrum is better than the C64 year after year.

Point taken. To expand on that point, I suppose that all of today's
computers have an 8-bit heritage.

A computer can not do anything that exceeds the capability of the hardware.
In other words, WHAT THEY CAN DO depends to a great extent on the hardware
available for use by the CPU, and hardware available to give the CPU a
helping had with some tasks.

> The C64 has sprites... so does the spectrum. Hardware or not.

Using 1980's terminology the Spectrum does not have sprites. It can be
programmed to use MOBs (Movable Object Blocks). MOBs were also used in many
other 80's machines, for example, IBM XT Clones with CGA.

On the screen, a MOB looks a lot like a sprite, and may even move somewhat like a sprite. The trouble is, that even with the block memory move command of the Z-80, moving half a dozen MOBs takes huge slices of CPU cycles.

As the 80's turned into the 90's, video cards for PC Clones were improved. The ability to move object blocks without eating huge amounts of CPU clock cycles was implemented in the better video cards. And then came 3-D video cards. PC Clones had always been good at word processing, spreadsheets, and data bases. Now they were good game machines also!

A quick ebay search finds 3.

Whilst a search fo Amiga soundcard or Amiga sound card draws nil.

About 10 Amiga 1200's on ebay, none with sound cards.

Mark

Define what a sprite is then. because by your very own definition, a sprite is
also just a MOB.

Movable objects that are not painted on the bitmap but over/underlayed on
screen by the video chip.
They're called also missiles on Atari. Normally a MOB is referenced as
Software sprites, ie on the c16/+4

This one of the most comprehensive article about the VIC Chip:
http://www.minet.uni-jena.de/~andreasg/c64/vic_artikel/vic_article_3.8.htm

And for what it counts, these are the definitions in wikipedia (scroll down
to "Hardware sprites")
http://en.wikipedia.org/wiki/Sprite_(computer_science)

You're an idiot. You simply keep moving the goalposts so that in your mind
you can never *lose* the arguement.

FYI it's an arguement you can never *win*. The Speccy simply is more limited
then the C64, and that is all there is to it.

The problem is that they still do not understand the question.
To elaborate, a sprite is a sprite, hardware or software, to the effect
that the user sees the same thing.

If you quantify then you could ask:

Q. Can the Spectrum draw as many sprites as a C64 can at the same speed?
A. The answer is yes regardless of how it does it.

Q. Can the Spectrum display colours at a 8x1 attributes like the C64?
A. Yes it can (same as above)

Q. Can the standard Spectrum play digitised sound or 3 +1 sound?
A. Yes it can (via Software yes...) but it does nonetheless

Q. Can it peform number crunching faster than the C64?
A. Yes it can.

See if you ask qualitative answers, these are subjective and they can
never be answered in an impartial way.
Quantitative answers though can be answered... even if one doesn't like
the results.

Now you could say that you don't like the results of the demos, or how it
sounds or a number of other things. That's fine... I personally do not
like fish ;-) You cannot make me eat it even if it's the best thing in the
world. Same with your machine of choice. If you say that you don't like a
machine just... *because* :-) That's an acceptable statement even if the
other party doesn't agree with it.

The facts though support Starglider. Anything that the C64 can do (except
run a webserver maybe) a Spectrum can do too, regardless of how that is
achieved.

What has been going on, is that one sayss the equivalent of the following
statement: "It is day outside". And the answer instead of being
acknoledgement of the fact, becomes: "Well I do not actually like the
particular blue of the sky, ergo it is night)

My 2 cents

Cheers,

Phoebus

I hate to make an off-topic thread go further. but you have my curiousity.
Why would having sex with another man get 10-15 years? People do that all
the time. (not me, by the way, I like girls)

Because if I have to go out and pay $$$ to add something to an Amiga just
to bring it *up* to the level of my Falcon...well, I'll just stick with my
Falcon. :-)

> Where would you find a Falcon period?

Right now? About 2 feet away... :-)

--
_/_/_/

> meg ram. Hows the chip ram on a standard A1200?

Slower. Other Amiga's have faster CHIP Ram. Designed for 8MB.

Ditto here. I've got a CT60 powered Falcon (95mhz '060), with 256 megs of
SDRAM, 14 megs ST RAM, 80 gig Maxtor IDE HD, PlexWriter 12/4/32 SCSI CDRW,
450 watt ATX P/S, wrapped up in a Wizztronics Falcon rack case, running
the MINT OS/Thing desktop.

I've owned (in order), an A1000 (I still like the layout of this machine a
lot, especially the keyboard well), an A2000, and an A1200. None of these
Amigas could match my stock Falcon, let alone in its current state.

Just for the record, I really do like Amigas... If I could find a good
deal on an A1000 in good shape, I'd probably pick it up for old times
sake. I just think my Atari comps are a notch above them.

I have a lot of respect for both computer lines and their (important)
place in computing history.

C'mon Clockie, can't we just acknowledge that both have strengths and
weaknessess and let be? :-)

Yeah, the Falcon is a nice seat. ;-)

Plaese stop .... rotfl.. this all Falcon Amiga Stuff...

The Falcon does not have the slightest chance. Well, it does have it's Strenghts, DSP, MIDI, IDE (erm..)etc... but let's say real - AMIGA is the right HC. Or, it was at that time. Falcon was a last attempt to save something which don't want to be saved. Instead of making a cheap, and better than the ST, new Design (again with MIDI), they tried the onboard-sound Sector (ruled by Paula, SID, Archimedes, ULA), already being collected by PC and Soundcards.

Nice Machine.... but vs. the AMIGA. hmmmm. I had A4000/030/040, A1200,

A500/+ (2MBChip, Standard and not soldering), A2000, A2000/040/060.
1024x768 True Color Z2, 68060/60>MHz (like a p100-200), Fast-Scsi II
...... at this time Atari started with the first 040 clones... ha.. I
have pulled the 060 in the A2000 and it worked. With every Z and ISA
Card, indeed.

Five Years after AMIGA died, the IBM-PC overtake. Yes, Yes ... at least
five years.

Well, today I am as fast. But at least the noise level, got nearly off.
PC.

Best Regards,

Daniel Mandic

I had a A1000 for a while, swapped it for a A500 then got a A2000. Got
given a CD32 for fixing a few Amiga's for a friend. I love it. Have a
350 meg HDD and 8 meg in my SX1 ;-) I could watch demos on the Amiga and
Atari all day (before I had kids - better get the little on up I suppose).
>

Damn straight. Amiga and Atari were out of the same stable. Whether
anyone wants to admit it or not. If it wasn't for Atari the Amiga would
not have seen the light of day and if it wasn't for Commodore the ST
would not have seen it either.

Its an awesome machine. Sometimes I just sit in amazement when I turn it
on and watch it bootup. Even with MINT, it boots up blazingly fast.
Honestly, I can't follow the onscreen text!

I hear ya. Love those Euro-style demos. Like you, I'm mesmerized by them.
I could sit and watch Sonoluminesence, Hydroxyd, etc, etc, etc,...all day
long.

You can find a good selection of Public Domain and Shareware/Freeware games
here:

http://cmdrkey.com/cbm/genie/C128GamesListing.html

As with any collection of this type, some games are good and some are not.
Try several until you find some that you like.

Thne you're tone deaf, as it's doing exactly the same effect as a SID chip does.

Oh god no, I'd rather play commercial stuff.

I've never been interested in free domain stuff. Even on the Speccy, I've
preferred to play the old 80's games you could buy off the shelf.

I'm funny like that.

Maybe so, but so then is Fatboy Slim, who uses ST's to make his dance tracks
that have sold millions around the world.

|>>
|>> 320x200 pixels?
|
| More than that! 512 x 192 (T/S 2068 - Since we're comparing American
| computers ;-)

We were talking about the Spectrum, not the Timex. The Timex wasn't
very compatible with the Spectrum, and there wasn't a lot of software
produced for it, was it?

|>> Smooth scrolling?
|
| yep and then some with buffered screens (256 x 192) ((T/S2068)

How about the Spectrum?

|>> More than 2 colours in one 8x8 pixels grid? -
|
| Yep 256 x 192, 32x192 attributes ;-) (T/S2068)

How about the Spectrum?

|>> 3 voices of highly programmable sound? -
|
| Nope, more: 3 +1 AY-3-8912 (T/S2068, 128K, +2 etc..)

How about the Spectrum?

|>> What could the Spectrum do that the C64 couldn't?
|
| * Faster tape loading - Up to 6Kbps :-)

The stock tape routines of the C64 sucked, yes. But most games
used some sort of custom turbo tape routines. Most applications
were released on floppy disk.

| * DMA support and memory bankswitching (T/S 2068)

How about the Spectrum?

| * Superior Basic (and with GW & Se BASIC... PERFECT BASIC)

Lots of basic extensions and replacements for the C64 as well, though
just about anything worth having were made in machine code anyway, for
both the Spectrum and the C64.

| * Slow Scan TV! (Yes)

Please elaborate.

| * Drive your Commodore-owning neighbour mad (always a plus)

Spectrum users didn't need any such driving, or if they did,
it was a very short ride. :-)

| * Appeal to girls ;-) (Black is always in fashion)

A-ha, so _that_ is why all Spectrum users are women...

| My question was not what hardware has the C64 got that the Speccy hasn't got.
|
| My question was what can the C64 do that the Speccy can't?

What can be done with software is very much dependent on the hardware on which
it is run and not much else, so I fail to see the distinction.

Sure, I never have disagreed with that but the claim that ST's are better
then any Amiga is nonsense.

Euro style demos on Amiga = heaven.

Ok Atari too but they weren't as impressive you have to admit.

Nonsense - the SID chip is an analogue/digital (mixed) synthesizer
with proper envelopes, lots of waveforms and a filter. It sound is
very complex - even PCs can't replicate it perfectly, let alone a
Spectrum on an AY.

You're timbre deaf!

Wrong. There are options for Atari's as well.

Yes, very nice in its standard configuration. Of course, mine is way
beyond "stock" now:

95mhz '060 CPU
256 megs SDRAM
14 megs ST RAM
80 gig HD
Plextor 12/4/32 CDRW
Wizztronics Rack case

The question is Clockie, do you prefer your nowadays PC over your Amigas?
There is no doubt that my AMD powered Linux box with a 19" monitor, 120
gid HD, 512 megs RAM, etc, etc out-specs my Falcon (and your Amiga), but
which do we **enjoy* using more? :-)

>>> Where would you find a Falcon period?

> Sure, I never have disagreed with that but the claim that ST's are better
> then any Amiga is nonsense.

I still disagree with you here. Why? Because use of a computer, is very
individualistic. "Better" doesn't necessarily have to mean hard specs that
are better or less from one computer model to the next. Give you an
example, setup my main AMD computer with Windows. XP, 98SE, it don't
matter. Then set it up with Mandriva Linux. Which is more enjoyable? For
me, beyond any hope of arguement, its Linux. I think Windows (any version)
and MS suck vacuum hard. Its the exact same hardware, but the machine is
absolutley *totally* different under these 2 OSs. One for me is enjoyable,
the other is a real PITA.

Same with the Amiga and Atari. Sure, on some individual models, the Amiga
has some better hard specs. Sure, on some individual models, the Atari
line has some better hard specs. There is nothing wrong with Intuition and
Workbench, I just feel infinitely more comfortable with TOS. So, as I
said, its very individualistic. Thats why I feel when someone says,

computer X is better than computer Y, and someone else says thats
nonsense, I can't help but feel that the issue is being overly simplified.
I could accept it if you said, "the Amiga is better for me". As I'm
saying, Atari is better for me... :-)

Everyones mileage may vary, of course.

Yes and the reason for the link was that it can run a webserver (not the
TFE hardware but the actual software) and connect to the net. They can, we
can't (darn).

We're probably closer to having web-server hardware for the Speccy than
we are to having web-server software, though.

the distinction is that with a stock C64 and a stock Spectrum, there's really nothing (bar the resolution) that the C64 can do that the speccy can't in games or apps.

Moby too at one time I believe. None of that proves a thing though, the
amount of TV networks, artists and studios etc that used Amigas is just as
impressive.
They were the glory days for the niche systems...

The Amiga was simply a more capable computer. Sure, the ST was better at *one* thing out of the box, but that was it.
Read the hardware specs, from a technical point of view the Amiga is simply much more impressive.

Give you an
> example, setup my main AMD computer with Windows. XP, 98SE, it don't

OS choice, yeah OK I've tried Linux and Windows of various ilks and now use XP.

Sure, it's subjective and that is a fair enough but for me using TOS is like
going back in time to the dark ages.
Remember, I had both an ST and an Amiga at the same time (ST first) and I
simply cannot see the benefit of owning an ST unless you are into MIDI.
The ST simply lacked that jaw dropping WOW factor the Amiga had.

To each their own.

Absolutely. Games like BF2 rock, the application choices are wide and varied
plus XP is good. I hardly use alternatives at all anymore.

To be honest, I enjoy my PC. I still wish the multitasking was as fast and
smooth and efficient on my PC as it was on my Amiga, but of all the OS's
I've tried none come close.
Ah well, I can live with it.

Imagine if C= and Atari had kept going and actually got their shit
together... where we would be now.

Probably doing this ;-)

"Construction Set"? I'll look for this. Thanks!

I did find this:

http://ftp.atari.art.pl/stuff/collections/nir_dary_cds/Tech%2520Info/SPDOS.TXT

> Steve, I'm not aware of any utility that could differentiate different
> Dos disks. I think that would be pretty difficult, unless the actual

I should have realized this and probably would have if I took the time
to think. Maybe not. Sometimes I'm just slow.

- Steve Sheppard

Again, you're missing the point. I said what can the C64 do that the Spectrum
can't, regardless of hardware.

Now Sprites... Yup, speccy can do that.

Next?

And more so, an Atari ST MIDI user.

please do keep up yourself!

I'm pretty certain they didn't, although David Whittaker did use their samples
to great effect to recreate Megablast for the game.

Bomb the Bass were big Amiga fans and did in fact use them. So do Men at
Work, and numerous DJ's and electronic artists around the world. Listen to
JJJ and Paula's distinct ring pops up time and time again.
EA still uses Amiga 1200's for creating voice synthesis and sound effects in
games too.

I've seen nothing sprite wise on the C64 that impresses me. And saying that is
not a troll. I seriously haven't.

Not just the sprites champ...

Gotta say though, Spectrums make damn fine clay pidgeons.

Sadly if he was caught video-taping him having sex with
another man, he would have received 10-15 years, and a
much steeper fine.

Ugh. Hate MS products. :-(

I like Linux though.

Been there and done that. I'm over it, Linux is overrated at best and a nightmare at worst.
I just want my OS to work, run what I want to run and I don't want to spend time rooting around just to get something to work.

Oh, I never needed one on my A500 and 1024x800 A2024 monitor neither.
And how well BTW your ST worked in a video editing environment _without_
the interlace modes?

Finding vendors... no problem.

It's trying to get useful information that's pain in the butt.

Hope you find some fun stuff!

Steve Sheppard

Goes without saying, the xbox of course, it won't run either M.U.L.E. or
Lords of Midnight :-)

Come to think it, was there a conversion of LoM for Atari ?

No, but you can emulate a speccy on a ST or better.

Besides the best 8 bit game was Alternate Reality, closely followed by
Star Raiders of course. ;-)

I know this is an obvious troll, but I'm caught on the hook.

I say the XBOX 360 because it comes from M$. At least the original XBOX
could be modded into something almost resembling a PC so it wasn't TOO
bad - anyone got Linux up on a 360 yet? >.>

A while back I stumbled onto a Web Site that was in German.

It had pictures and diagrams of connecting an Atari 800XL to an
Atari Falcon 030. I am not sure what the purpose was as it
was in German. But it looked very interesting.

However, I have lost that URL, and haven't been able to find it.

Does anyone recall seeing this Site and or possible have the
URL for it.

If so, post it or send it to me in e-mail.

Thanks,
phantomm@bellsouth.net

Most of us have heard of the SIO2PC.

I have one of these my self.

Was or is there a SIO2ST similar to the SIO2PC board?

If so, I could use any info about it, A URL and or place to get it.

I do have the X-Former Cable and Software, that allows one to transfer
8-bit files to the ST.   I have put together, some of the best software
and it
does work quite well. Although some of the software didn't work that
well.

That was the reason I took the best out of different versions of
X-Former and
mixed in some other software. I can now easily transfer 8-bit files
straight to
ST disks in the 8-bits normal file mode.

And with a 8-bit emulator running on the ST, one can access the 8-bit
files
straight from the ST disks, without having to de-arc them or use some
type of compression. The files will run straight from ST Disks.

However, I would like to know about the SIO2ST if it exist.

I did find a site where the X-Former Cable could be modified to work
on a PC. Only a few wires have to be changed.

It is on the X-Former Site if I am not mistaken. Just Google for
X-Former if interested.

Are there any projects availabe for the USB cartridge?

I'd like to see someone come up with a program that would allow
those small USB memory drives to be used.

Has anyone tried this yet?

Why run Linux, if you could run Mac OS/X on it?

The Spectrum for hard floor surfaces.

If you flip it upside down those rubbery keys act like 130 (or
thereabouts) little grippy feet.

Xbox360 - will never buy it - Burnt once with an Xbox - will stick to
the Gamecube (and nintendo)
Spectrum - not enough experience with it to say one way or another

so

Atari vs C64

Atari 8bits hands down beat the C64. Better graphics, better sound,
better basic (with the exception of the screwy DIM statement), better
expansion etc. When using the C64 it just felt like it was cobbled
together by a commitee and then given to the programmer to figure out
how to make it work.

Well, if you think about it....
The Xbox 360 costs microsoft over $100 for every model they sell...
Their goal is to recoup these losses on games...
But, if you bought it, installed linux, and used it as a quite powerful
little server or desktop box...
Well, that's depriving them of their recouped losses, and the more people
who do that, the more trouble it causes them.

Better graphics? Better sound? My favorite game is Trolls &
Tribulations which was hands down much better on the C64 than the
Atari. Same with Spelunker. Even some of the Atarisoft titles were
better on the C64 than the Atari. Strange, but true!

Cobbled together - true. Left to programmers to figure out how to make
it work - true again.

But I guess for a machine that was quickly put together and nobody knew
how to use, it did pretty darn good in the marketplace.

Now, back to the original thread -- best doorstop - the Timex Sinclair
- after all, its shaped a lot like a wedge.

Linux vs Microsoft - who cares! That debate is tired and worn out!

XBOX 360 - got one for my son for Christmas. Lets not forget that
these systems will be the Commodores and Ataris of their generation.
As long as he's happy with it, I don't care if its made by Microsoft,
Sony, or Nintendo - it's what he wanted. Besides, what's wrong with
having them all? Some games are just better on specific platforms --
why not play the game where it's best?

Not better, other. The Pokey does strange effects, a SID is not capable
to do ... Vaccuum-Cleaner (Out-of Phase) and more. Four Channels!
 No Filter :-(

The SID is maybe more virtous but can be lousy to irksome. Depends to
the Composing and choice of instruments.

GfX. I would not say the Atari Chipset is better or faster then the
C64. The VIC is not so bad, though i prefer Antik.

Best Regards,

Daniel Mandic

P.S.: Only beaten by a Sinclair Personal Computer! Depending Colour
choice and High-Res Mode. Who cares about Sound, today 24bit
PCI-Express Soundcards are only snot for me :-) compared to a well
recorded Record.

XBox... What's that?

> > Atari 8bits hands down beat the C64. ... better sound

That must be why no-one has heard of the SID chip. Oh, wait. Everyone
knows that the C64 music was the best of the 8-bits and the SID was
voted as one of the most important chips ever made by Byte magazine and
people are still making re-mixes if C64 tunes because they were so
good.

>cobbled together by a commitee

No. It was Bob Yannes and a few other people. They were left to
pretty much do what they wanted. Definitely not a commitee.

Anyway, the original question was about door-stops, not what is inside.
 The Spectrum is clearly the best for that as it is the correct shape
and has been used many times for that exact purpose. The Commodore
employees used to use them (or it might have been ZX-81s) as door
stops. A prototype C128 got its Z80 chip from one being used as a door
stop :-)

Interesting that the C128 got its Z80 from the Timex Sinclair. I always
thought if you painted the C128 black it would look like either:

A TS1000 on steriods

or

A sterile hybrid from an illconcieved mating of a Vic 20 and a TS1000

Still - more software was written for the ZX81 / TS1000 than ever was
written for the z80 mode of the C128 (and this does not include the
CP/M software - that existed before the 128 was made).

All that aside. I actually liked the look of the C128 - must be hybrid
family resemblance slipping through.

On a slightly different topic. Has anyone ever considered using the
C128 z80 side to write a ZX81 or even Spectrum emulator? May go a long
way to mending fences... (in the back of my mind I hear Yoda "Dark side
of the force, powerful it is"

> little server or desktop box...

I really don't see the point why I should spend $400 for an underpowered
machine with hardware problems. An XBox is a nice game system, but most of
its power (The whole CELL architecture, for instance) is rather pointless
for a server. For $400, I can buy a PC which is *much* faster than an
XBox-360 _for desktop and server use_.

Apart from the fact that it won't be a quite powerful little server (it'll
be a rather crap and underpowered little server), nor a nice desktop
box (It's severely underpowered for that), is "Microsoft is losing money
over it!" really a valid reason?

"Hey, if I pay $400, Microsoft will have to shelve out another $100!". Somehow
that doesn't strike me as a solid business plan, if the goal is to make
MS bankrupt.

> Well, that's depriving them of their recouped losses, and the more people
> who do that, the more trouble it causes them.

Right now, my bank account will miss that $400 a lot more than MS's bank
account will miss the $100. It kind of sounds like "Hey, I don't mind breaking
my legs, as long as you get a black eye during the process"

It's overheating due to a faulty heatsink. This probably isn't the
case with European machines. Most of the machines are crashing inside
store display cases - why? Because they're badly ventilated. Also, the
poll that claim 16% of machines are broken is hogwash - because people
with broken machines are more likely to add to the poll and register
their disgust than people with working machines. There haven't been
any reported problems with consoles not working on startup, as far as
I know.

Too slow, isn't it?
Didn't they do something incredibly stupid like clock both CPUs to 2Mhz or
something?

Not right at startup but after only one game (in a well ventilated room!)
my daughter's boyfriend's 360 started flashing all red indicators and
refused to
work at all after that. He called the toll-free number and had to wait 45
minutes
to reach someone at MS. The guy there said they were being swamped with
calls about dead units. No one listens to me when I tell them to wait a
month
or two to let other people work out the bugs. If you want the actual
figures on
360 mortality, buy at least one share of MS stock. They have to tell
shareholders
the truth by law (at least in the US).

Tom Lake

Before using a computer for a doorstop, you should rip the ears from a troll
(Blaine Adamson's ears will do), and glue them to the bottom of the computer
so that it does not slide as easily on the floor.

You've lost me. how exactly are they losing money if they make the machine for
$100 and sell it for $300?

I think he means that they take a loss of $100 on every machine.

I'm think they know more about their own marketing than sneering
snipers on the Internet, personally.

Oh, Spike's not a sniper, he's an old net friend in these Speccy parts, but I do agree that the "costing Microsoft $100 for every 360 sold" is nonsense.

The original XBox only lost MS $40 per unit at the $100 price. And that was simply done as a tactic against Sony to gain market share fron their first console. now they have that share, they are being more money-wise. they will clearly make a profit from each machine until such time they price match Sony's PS3 in the future.

But the damage to Sony has already been done, by getting there first with the next gen consoles. MS will have an almost clear 6 month headstart on Sony with the 360, and with the already successful Live service and ever increasing backwards compatibility that the 360 provides will only hurt the not-entirely stable company that is Sony.

Ha ha. This is a better troll than the original post. The C64 is STILL
light years ahead of anything Atari ever made.

Indeed. I think people writing RPG games today should be required to
look at AR before they start coding. I still count it in the top 5
RPGs I have played and its 25 years old! The level of immersion is
just something you do not see today.

You're high.
> Better graphics,
This is demonstrably false, and I suspect you are relying on people not
having knowledge of both platforms.

The Atari 8bit hardware modes are severly lacking by comparison to the
C64. I use the highres mode as an example:

C64 Hires = 320x200 with 2 colors PER 8x8 cell (from a pal of 16)
Atari Hires = 320x192 with 2 colors PER screen, sharing a HUE!

And then there are the software modes, of which the C64 has legions, but
I will name only two of the simplest that both defeat all of the Atari
software modes that I know of:

C64 FLI = 16 colors in 136x200
C64 IFLI = 256 possible colors in 160x200

Atari APAC = 256 in 80x192
Atari Colorview = 4096 at 80x192 with terrible rolling
Atari HIP and RIP suffer from is inferior with

 >better sound,
Not by a long run, though I suspect this has more to do with the coders
on that platform than the hardware itself. After all, it does have one
more "channel" than the SID, though the POKEY's 4 "channels" are not
nearly as independent of one another as the SID's "voices".

The SID has ring modulation, the POKEY does not, for example.
Put simply, while the SID could emulate a POKEY's sound, a POKEY could
not emulate a SID's sound. It simply lacks the features.

 >better basic
This is more a matter of opinion, though the C64 has a quite powerful
BASIC, and didn't need to load it's DOS from a disk. The Atari BASIC
had some graphic commands similar to BASIC 7.0 on the 128.

> better expansion etc.
Uh, no. There is an enormous array of devices widely available for the
C64 that you simply won't find even today on the Ataris. Quick and easy
hard drives are one example.

> When using the C64 it just felt like it was cobbled
> together by a commitee and then given to the programmer to figure out
> how to make it work.
This is by far the most ridiculous part of your entire statement. I've
used both, and having been in the position of wanting to use my Atari
and lacking a DOS disk, will take the C64 over it any day. (And don't
even get me started on that stupid SIO connector.)

Please, if you're going to make statements like this, stick to
quantifiable comparisons. We all like our machines of choice better
than any other, and I'm sure we are all tempted to claim that they are
the best.

I would be happy to stack the C64 next to an Atari, Apple, Spectrum,

CoCo, whatever of similar spec and compare feature for feature.

Frankly, in these days where knowledge of these older platforms is
dwindling, we should try to set aside our petty differences, our
communities should be coming together to support one another, to explore
other retro-platforms, to share our enjoyment of our favorite platforms,
to recount our stories of the glorious BBS-era days, and to become one
single unified retro-computing community which embraces all platforms.

Just my %10 cents.

Really! In that case, it was probably dropped because EVERYONE knows
that TI'ers want everything for free, and wouldn't spend a dime on it!

Ah, but John Black never specified that limitation. The Atari ST in many respects does trash a C64, but it comes from the hands of Tramiel you know. :P

Some of the Atarians will tell you that "all professional machines
need", which of course doesn't change the fact that it sucks on 8-biter
with floppy, eats RAM, slows down the startup etc.. Hey, it sucks on
each and any-biter with floppy only but gives them their delusion of
"professionality" ;-)

>> better expansion etc.
>
> Uh, no. There is an enormous array of devices widely available for the

Well, they do have harddrive solutions (I own three of them) but...
somebody forgot to write a DOS to boot that would support something
beyond 16MiB on a partition, not to mention that somebody forgot to
write a DOS to boot that would allow normal usage of removable media
like ZIP/LS/SyQuest etc. and of course I wouldn't call any of those
solutions "quick and easy", especially when compared to the 64 based
ones but of course: "ataris have better expansion possibilities" ...

> I've
> used both, and having been in the position of wanting to use my Atari
> and lacking a DOS disk

Uh, oh... ;-) Have you tried booting from cassette? ;-) ... Erm, that
would require a DOS cassette... erm so you can't just easily check
what's on the diskette and load a binary from it? Hm... I think that's
the price for "professional" feel of the bootable DOS ;-)

>, will take the C64 over it any day. (And don't
> even get me started on that stupid SIO connector.)

That actually is possibly not THAT stupid. At least it was faster than
the crippled IEC SERIAL bus on the 64... :-(

And the Amiga from Atari;-).

IIRC the guys that developed the Atari 8-bit designed the Amiga and the
guys that developed the C-64 developed the Atari ST.

No delusion here, I wouldn't consider the C-64 pro either. However we
both could do things the big PC's could not;-)

No one forgot, in 1978 there was no zip/ls/syquest avaliable. Who cares
if it is better or worse on either platform? Both had strengths and
weakness'. The debate is over, neither won.

Dos is Disk Operating System. Not cassette. Personally I never got left
without a copy of Dos 2.5. Just bung it in the 1050 when you move it.

Ain't that the truth. I could not believe the loading times on the C-64
when I first saw one. Personally never had any hassles with SIO either.
My 850 works fine;-).

Yes, the Commodore 64 and the Atari ST were both created by the same fertile
minds.   :-)   When Jack introduced it to the world, the Commodore 64 was
the best 8-bit computer of its time.

Jack wanted to build a 16-bit computer better than the Amiga, but Irving
Gould would not let him, and booted him out of the CBM organization. So,
Jack had to settle for second best and build the Atari ST.   ;-)

I used to have an XT Clone that had MS-DOS in ROM. The Custom Phoenix BIOS
could be set to boot from ROM, A: drive, then C: if no disk in A:, or C:
without checking A: first. The DOS in ROM was version 3.31 IIRC.

Booting from the hard drive was reasonably fast, but a boot from ROM was much
faster, even if doing so was very unprofessional.   :-)

Drill a hole in the case, insert one stick of dynamite, and the Atari will
expand quite nicely!   ;-)

Which was a better computer than the Amiga games console;-).

The Amiga was initially setup by Atari, don't forget.

Man this is like 1990 all over again. Look we all know the Atari
machines where the best.

Mark

And the guys that wrote Amiga DOS 1.x wrote it on a Sinclair QL using
Metacomco's BCPL of all things :-) (Well at least the kernel)
Plus the Amiga can execute QDOS software natively using QDOS Classic -NOT
an emulator really- (and there's even a replacement Kickstart ROM that
turns it completely into a QL). As a matter of fact until the Q60 <url:
http://www.q40.de/> came along, a souped-up Amiga (with an 060) was the
fastest QL compatible that one could get his hands on.

Talk about being in bed with each other. One big Atari/Amiga/Sinclair
family. Here's a question, was Amiga DOS under development during the
period Atari were going to release the Amiga?

Mark

Moving from the ST to the Amiga was like a revelation. The ST was the
weakest of all the Motorola 16 bit computers from that time.

Having GEM as the GUI and a DOS clone as the OS didn't help much either.
It was basically a PC with a 68000-class CPU.

I'm looking for a utility to at least read Sparta directories from
MyDos (or other Dos 2 - type dos versions). Is anyone aware of such a
utility? Thanks.

No, better is a C64 with a Software-Sequencer (24) connected to a
synthesizer. That's digital. Forget abot th's clunkky, lousy and
irksome digital-soundchips. They are sounding alltogether terrible,
also SID.

Kind Regards,

Daniel Mandic

Hmhmm.

Only the Space Shuttle has been designed and developed on an ATARI.
nop, that?s nothing, I know. So seen, is ATARI the most living Computer
Brand!!!!!! And much better in sound than a C64, of course.

Best Regards,

Daniel Mandic

Hi Matthew!

You mean 16MB, yes? :-) But how do you came to 16Bit 50KHz?

Best Regards,

Daniel Mandic

Fortunately. That Irving Gould and Mehdi Ali are the most worse
IT-Manager I ever knew and know. bahh...

But at least the ATARI (8 and 16bit) is more usable, today.

Daniel Mandic

P.S.: Speccy is full Support. Better than ever! Forget about all other
8bit.

I forget.

Jay Miner initiated the Antic-descendent (however he would have name
it). Money was low, so a Joystick Company called AMIGA adopted
(cooperated) the financial things..... ATARI could buy AMIGA and the
A1000 but Commodore paid obviously more for the mighty AMIGA. Etc
Etc-.....

Depends. For a MIDI user, second best was the Amiga. :-)

For everyone else the Amiga was best.

Listen to an Amiga MOD on an ST for a laugh, it's so pathetic.

Odd then, that I'm -not- a MIDI user yet still chose the ST line.

> Listen to an Amiga MOD on an ST for a laugh, it's so pathetic.

Sounds very comparable on an STe...

Look Clockmeister, I believe we've talked before. I've actually owned
Amiga machines in the past. They are nice. I like them. I just prefer my
Mega STe and modded Falcon more. Each machine has its advantages and
disadvantages, agreed?

I tried this with my Falcon, but discovered hardware mods are
necessary. Forgive me if I am incorrect, but I think it is because
of the SCC chip instead of MFP like the ST. I have the SIO2PC cable
connected to my 1040STe with 800XLDJ and it works great (wasn't
willing to modify my Falcon).

You can use a standard SIO2PC cable with 800XLDJ (800XL DeeJay)
software. Works great!

I can't beat the ST specs but my 8-bit commodore next to me does a pretty
good job.

3.5 MHz
4096 colours pallete at 640x200
Double SID
Max of 8 Mbyte RAM

Show me a 8-bit ATARI system which comes close.....

Yes, the Frankfurt Group of ABBUC is working on that. The next programming
weekend is 10/11. Dec.

We'll post pictures and progress report on monday, 12.12.

Best regards

Carsten Strotmann

Yeah sure, not like it matters anymore. Besides, it's OT in this group.

First time I used an Amiga I could not believe how slow and clunky it
was. Shudder. It also creaks.

Apart from the fact it is Mono on and STFM it sounded OK. The STE easily
sounded as good, if not better (50 Khz). And the Falcon..... Amiga

wasn't in the same league.

When my parents got me a 400 and the entertainer kit for christmas '82,
it came with star raiders and pac-man. I couldn't tell ya what was on
the box, it is long gone.

I thought the second game varied according to what was hot at the time.
 I know something was offered before the pac-man cart was available,
missile command sounds right.

No it didn't, it was awful.

The STE easily
> sounded as good, if not better (50 Khz).

Nope.

And the Falcon..... Amiga
> wasn't in the same league.
>

Correct, it actually sold in numbers.

Next.

Slow and clunky is the GEM/TOS insult to computing coupled with very
ordinary hardware.

So VHS was better than Beta? CD was better than DAT? Spice Girls are
better than the Eagles? Numbers do not a computer make. By that analogy
the Amiga was a POS compared to a 286.

Next.

Mark

It wasn't. Multitasking worked very well on the A500, the GEM/TOS hybrid was
neither here nor there.

 How are your eyes after all that
> interlacing?
>

How did you find space for two monitors?

No wonder since, as I stated previously, Amiga DOS was written on a
SINCLAIR QL :-P

I get some visions of HAM mode though and my eyes hurt even more than with
an ST.

Cheers,

Phoebus

Not at all since I never suggested that the Amiga was better because it sold
in numbers, only that it did and the Falcon didn't.

> Next.

Careful, your bias is showing.

7.14Mhz Vs 8Mhz? Tos worked well for me, I am not sure what you were
doing wrong. I found the Amiga piss farted around too much and took ages
to boot up too.
BTW my Atari's Multitask just fine as well.

So what is your point? Or was it just an observation?

So how is the 16bit DSP driven sound on the A1200 anyway?

Nor were the harddrive solutions for the 8bit Ataris?

OK :-) I almost can't belive me taking part in this debate but it's kind
of strange fun ;-)

But it's still a software - I was joking that maybe he could boot the
Disk Operating System from the cassette...

Ain't that what I just wrote? I believed SIO to be actually,
unfortunately ;-) better than the C64's SERIAL bus... at least in terms
of speed.

Not then, no. In fact I don't think Atari ever made a hard drive for the
8-bit. Could be wrong tho.

It's like it is 1988 all over again, lol. I wasn't going to bother, but
it is fun. I was in a Atari/Commodore club, it used to go on all day.
The best thing was proving the other camp wrong;-).

It is most likely possible, too. Never tried tho.

It was like torture, I have 3 C-64's in the shed, never had time to play

with them though. Too many Atari's to choose from. Actually I have 2
Falcon030's (one with CT2), a TT030, A MegaSTE, a STE, 6 STFM's, a
520ST, 130XE, XEGS, 2 800XL's (one with 256k ram and Omnimon), a 600XL
(64k), a Lynx, a portfolio, a Jaguar, 2 2600's, 3 C-64's, A500, A2000,
CD32 (with SX1). Jez, I didn't realise I had collected so much, although
the wife does. No wonder I have no time;-)

Mark

Irrelevant when the CPU couldn't offload some of the workload to custom
chips.

Tos worked well for me, I am not sure what you were

> doing wrong. I found the Amiga piss farted around too much and took ages
> to boot up too.

The price you pay for a revolutionary OS. Multitasking was sweet...
And those silly partition limitations on the ST... what a joke.

> BTW my Atari's Multitask just fine as well.
>

Not like an Amiga multitasks, and how splintered are the OS choices and
compatibilities between them?

Fine. Ever heard of productivity mode... or a flicker fixer even?

A price I happily didn't pay. Like ram limitations on a Amiga 1000?

>

How is your knowledge of Magic, Mint, Multitos, Linux, Minix, SMS2,
Geneva and NetBSD? And which one were you refering to? Magic, Mint,
Multitos and Geneva are all relatively TOS/GEM compatible. How well do
ALL WB 1 apps run under current AmigaOS?

Did they come as standard on an A500 did they? I never needed one on my
SM124.

Mark

All factory standard were they?

http://www.czuba-tech.com/DEESSE/english/overview.htm

Hows about them apples?

Can a stock A1200 play MP3's? My stock Falcon can:-)

Nonsense! The Commodore 128 was much better than ANY Atari 8-bit.
--
Best regards,

Sam Gillett

Change is inevitable,
except from vending machines!

What RAM limitations? The RAM limitations of the computers were more to do
with economical practicality at that time anyway.

>>
>>
>>>BTW my Atari's Multitask just fine as well.

You have just proved my point.

How well do
> ALL WB 1 apps run under current AmigaOS?
>

Irrelevant when both the OS and hardware has progressed well beyond the
original spec in the case of the Amiga. And before you start on about the
clones, the Hades was compatibility hell.

> Did they come as standard on an A500 did they?

Any ECS machine with 2.1 could display productivity mode, and standard with
A500+.

 I never needed one on my
> SM124.
>

Didn't need to. We didn't need to buy a (hideously expensive at the time)
second monitor either.

8mhz is faster than 7.14mhz.

How much chip ram did the A1000 have? My STFM had 4 meg.

Which is?

Irrelevant when both the OS and hardware has progressed well beyond the
original spec in the case of the Atari.

The Clab Falcon MK2 was the ONLY Atari licenced clone. It was 100%
compatible with the Atari Falcon. All the other clones were developed to
run Gem apps, not to play Starglider. For that you keep an STFM around.
Much like you do on a modern Amiga, unless you emulate. On the Falcon we
had Backwards, which was a ST emulator for the Falcon.

What about A1000? That is the STFM era. 1985. 2.1 was 1992 was it not?

ALL 16bit and better Atari's could run with a VGA monitor. That is the
ST(M/F/FM/E), MegaST/E, TT030 and Falcon030.

Didn't need to what?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

In actual use the ST isn't faster because the CPU has to do virtually
everything.

My STFM certainly did not. It had 1Mb and it was a shit to upgrade it beyond
that..
The A1000 could handle 9Mb.

Oh c'mon, with that many choices it's obvious there was something
desperately wrong with the core.

And what a roaring success it was... not.

All the other clones were developed to
> run Gem apps, not to play Starglider. For that you keep an STFM around.

Rekick allows you to run even the oldest software on any Amiga.

Two very expensive monitors wasn't an option for most either, in fact that
idea was rediculous. At least the A1000 had the option, flickery as one may
have been.

> ALL 16bit and better Atari's could run with a VGA monitor. That is the
> ST(M/F/FM/E), MegaST/E, TT030 and Falcon030.

Too bad if you wanted to play games. I had a VGA monitor on my A500 also,
and it would have worked just as happily on my A1000.

>> I never needed one on my
>>
>>>SM124.
>>>

I had one of those, 12" wasn't it. Nice and clear, but way too small.

>>
>> Didn't need to. We didn't need to buy a (hideously expensive at the time)
>> second monitor either.
>

> Didn't need to what?
>

Plug another monitor in just to play games.

It's always the classic argument that Commodore users try to use as ammo.

"Oh, my commodore was faster as it had custom chips!".

When will you guys admit that custom chips or not, it doesn't equal that the
computer was faster.

C64=custom chips
Speccy=none

Faster? Spectrum

Now you've moved onto the ST and Amiga. Still the same argument though. I
believe the ST was still faster than the Amiga, even with it's custom chips.

Hell the Sam Coupe was almost as fast, and that didn't have fancy custom chips
AND it was only an 8 bit machine!

Actually, on an even more serious note, I'd like to play some C128 games.

Know where I can download some?

It couldn't do anything approaching what the C64 was capable of, so no
contest there.

> Now you've moved onto the ST and Amiga. Still the same argument though. I

The Atari wasn't anywhere near as capable as the Amiga, games had to be
dumbed down for the ST for instance.

And that is why it sold 22 million too I bet. Dream on, bedwetter. (Sorry
Paul)

You mean you can actually use the SIO2PC board on a ST/STE/Falcon as
long as
they will run 800XLDJ?????

With no modifications???

That would be great, let me know if I understood you correct.

Maybe that site had sometime to do with modifying the Falcon for the
SIO2PC.

But I don't remember seeing it.

It looked liked they were hard wiring a 800XL to the Falcon so that both
machines could
be used while connected together. If the SIO2PC doesn't work with the
Falcon, then maybe
this was a way to get them connected together.

BTW, When you connect an 8-bit such as a 800XL to a 1040STE with the
SIO2PC,
Where does the SIO2PC connect in the 800XL Chain if you have a couple of
disk drives
attached and maybe a Printer or someother SIO Device?

Can you have alot of stuff like the above connected to the 800XL and
still be able to use
the SIO2PC hardware on the 1040STE?

Does the SIO2PC hardware connection on the 8-bit side connect at the end
of the
daisy chain of SIO cables?

All my A8 developments seem to be on hold these days, in work's infinite
wisdom I'm now doing around 4/5 peoples jobs... I could cope with 2/3 and
still get A8 bits done, but this is silly ;) Still, its better than not
having a job so I muscle through.

When I do get back to coding, then AR City (&Dungeon) are top of the list
along with getting an internal myIDE 4 going.

Regards,
Mark

That flame between AMIGA and ST/TT is absolutely unnecessary. ST is a
Audio Expert and AMIGA is a Video Expert. Both can do their strenghts
w/o upgrading the Hardware.

Laughing about the flickermodes.... hey man, do you know what you are
talking about. Well, you could made your videoinlays with 640x200 in 4
;-) colors. I'd take a standard A500 with 756x572 interlaced, full
overscan... there you would need already a TT and the Overscan VME-Card
(already a slot used 0:1), though you will only have 16 clors and too
less lines. 0:2, 0:3.

Best Regards,

Daniel Mandic

Nothing sounds on MIDI better, than the mighty ATARI ST, TT or Falcon.
Forget it!

Tho only alternative, that is told to be as smooth as the ST-MIDI, is
the mighty Voeyetra-Set (ISA-BUS, Instrument and MIDI-Card) under DOS
and Windows 3.x.

Even that, the ATARI onboard-MIDI seems to work with all MIDI-capable
Devices ;-). Whereas the PC makes you more trouble in five weeks, as if
experienced with a ST/TT/Falcon in five years.

I'm sorry, I couldn't find prices for those cards. How much does it cost
to make an Amiga comparable, audio wise, to a stock Falcon? :-)

Faster tape loading - Up to 6Kbps :-)
Z80A processor clocked at 3.58Mhz
72K (48K RAM; 24K ROM) which is bankswitched between three internal 64K
memory banks called the HOME bank (16K ROM, 48K RAM), the EXROM bank (8K
ROM; this one is not completely decoded and can only hold 8K), and the
DOCK bank which is empty and is reserved for cartridges. The memory is
bankswitched in 8K chunks
DMA support and memory bankswitching.

Superior Basic (and with GW & Se BASIC... PERFECT BASIC)

Cheers,

Phoebus

More than that! 512 x 192 (T/S 2068 - Since we're comparing American
computers ;-)

>> Hardware sprites?

nope

>> Smooth scrolling?

yep and then some with buffered screens (256 x 192) ((T/S2068)

>> More than 2 colours in one 8x8 pixels grid? -

Yep 256 x 192, 32x192 attributes ;-) (T/S2068)

>> 3 voices of highly programmable sound? -

Nope, more: 3 +1 AY-3-8912 (T/S2068, 128K, +2 etc..)

>>
>> What could the Spectrum do that the C64 couldn't?
>>

* Faster tape loading - Up to 6Kbps :-)
* DMA support and memory bankswitching (T/S 2068)
* Superior Basic (and with GW & Se BASIC... PERFECT BASIC)
* Slow Scan TV! (Yes)
* Drive your Commodore-owning neighbour mad (always a plus)
* Appeal to girls ;-) (Black is always in fashion)

Cheers,

Phoebus

You guys need to get over this.

Take a leaf out of Nintendo's book - they've actually said "Our latest
machine won't be at all as powerful as its competition". They're
relying on good software and innovation rather than specs. Okay, they
might fall flat on that one, but if they can say that about their own
machine that will decide the future of their company, perhaps you
should let go and stop having these hateful arguments about computers
that are 20+ years old.

There's an important group you've left out of this crosspost.

I wonder if this will summon Scoopex?

My question was not what hardware has the C64 got that the Speccy hasn't got.

My question was what can the C64 do that the Speccy can't?

And apart from the resolution, which I do concede the C64 has got a higher
"mode", what else? The Speccy can do the rest.

>

I am sad to admit it, but there is one thing that the C64 can do and the
Spectrum (as of now at least) cannot...

see here: <url: http://tfe.c64.org/> and this:
<http://dunkels.com/adam/tfe/>

Someone make something similar for the T/S2068, the Speccy or the ZX81 and
I will stop whining immediately :-)

Phoebus

Nope. I could maybe make one, I have a little program that
reads sector 1 for First Sector Map and First Bit Map, then you can
look at the directory entries, which are 23 bytes, with info about the file
and the filename itself. You just want one that reads filename and size, or
also time/date, in use, deleted?

I'd be interested in such a utility too! (Pre-made or write my own)

Anyone have a link for the various SpartaDOS disk layouts? I'm personally interested in 1.1H and 3.2xx (the one realeased to PD is what version?), not so much for SpartaDOS X. Reading Bewesoft DOS disks would be good too (if there is any difference vs SpartaDOS formats).

Additionally, I would like to be able to copy files off SpartaDOS disks using MyDOS, not just view directories.

Taking this a little further, are there any Atari utilties that are good at identifying DOS disks, the format and the version number?

As far as I'm concerned it is just in jest.

No mods on ST or 520/1040STe. Falcon must be modified, not sure
about Mega or TT.

I have the cable at the 1040STe (at the end of the chain).

Hi Russ, Steve-

Russ, if you already have something, I'd appreciate a copy. BASIC?
Perhaps we could all three work on this? I do have the SpartaDos
Construction Set, so I presume that it lays out the details of the disk
architecture. The idea of being able to directly copy files from a SD
disk to a MyDos disk is certainly a good one. Sort of a "PolyCopy --
SD." Sounds interesting, fun, and doable.

Steve, I'm not aware of any utility that could differentiate different
Dos disks. I think that would be pretty difficult, unless the actual
Dos files are on the disk, and of course, it would be simple to
identify Sparta (and probably Bewesoft).

2 in the room I am typing this in. I have never seen an Amiga sound
card, seen plenty Falcon's tho;-)

One has a CT2, 80 meg of ram, 10 gig hard drive, zip drive, Yamaha cdrw,
Panasonic CD and the other is fitted with a 6 gig hdd and 14 meg ram.
Hows the chip ram on a standard A1200?
My CD32 with SX1 could not hope to compete with the Falcon.

I have upgraded a few ST's. The STE has simm slots built in. The STFM's
could use a marpet type upgrade that takes 15 minutes to fit, if you
know what you are doing. I have even done a few chip upgrades as well as
hot wiring in Simms directly. NONE of them were difficult.

> The A1000 could handle 9Mb.

Chip Ram?

What is wrong with choice? The Vast majority are just evolutions of the
same OS.

Or use a TV. The STFM had a built in modulator, why did the Amiga omit
it when the majority were used for games playing? Soooo many A500's I
saw with the A520 fitted, what a mess, not to mention the external brick.

Funny that is what Obi Wan Kenobi said.

You are in Perth aren't you? If you are ever in Melbourne, Pop in and I will let you have a listen to a couple of S3M's on a Falcon, through the Altec Lansing speakers I use in here. Heaven.

Mark

One Book I would recommend if you are new to programming on the
Atari 8-bit is called, "Your Atari Computer" "a guide to Atari 400/800
personal computers.

It has well over 400 pages of really good info and program examples.
It will get you started and take you thru Advanced Graphics and Sound.

There are also photos of various Atari Hardware.

When I was learning about Player/Missile Graphics, and
Sound, this Book was the one that helped me the most.

There are alot of good books on the subject, but I think you
will find this one very useful if you can find a copy of it.

It doesn't cover the XL or XE, but everything in the book is
related and all program examples will work on these 8-bits.

Compute! Magazine also did a few good books on various
subjects of programming the Atari 8-bit.

"De Re Atari" is another good one. Might be hard to get ahold of unless
its online somewhere.

Also" Mapping the Atari", and the Updated, Mapping the Atari that
includes info on the XL and XE.

I've seen some of these come up on E-Bay from time to time.

Anyone have a original, The Eternal Dagger, game with original box,
manual, and disks, for sale or trade?

I have a copy of it all, but would like to get it all original.

It was made by Strategic Simulations (SSI) and was a followup to
The Wizards Crown, one of my personal favorites on the Atari 8-bit.

Contact me in e-mail if you happen to have it for sale or trade.

I have been reading a few of the books listed on atariarchives.org.
Considering that I know nothing about programming, I must admit that I
find these texts rather intimidating. It would be great to find a few

books that introduce the reader to beginner programming by outlining
the steps for creating games. It is also quite obvious that this is
complicated not so quickly learned subject and would likely take months
if not years to get really good at. Basic seems like a good place to
start.

One of my all time favorite games is Temple of Apshai and the
sequels.

I have a full original "Temple" on disk and cassette.
And have most all the sequels and expansions,
but they are disk and manual copies.
I do have the original Manual for Temple of Apshai
Trilogy, but Disk is a backup.

I would like to find the following all original with Box, manuals,
and disks.

HellFire Warrior
The Keys of Acheron (Hellfire Warrior Expansion)
Upper Reaches of Apshai (Temple of Apshai Expansion)

Danger in Drindisti (HellFire Warrior Expansion)
The DateStones of Ryn (Don't have this one at all)
Morloc's Tower (Don't have this one at all)
Sorcerer of Siva (Don't have this one at all)
Temple of Apshai Trilogy

Most of the above titles are listed in a old EPYX catalog that
came with Temple. Except for Danger in Drindisti. I didn't
know about this one until someone sent me a copy years ago.

Would like to know if there are any other expansion disks or
a new title in the Old, Dunjonquest Series by EPYX.

Temple was the first Dungeon type game I played on a Computer,
a friends Atari 400. That was years ago, when it first came out.
I still have the old characters we made up on disk and paper.

Damn, those AntMen were pesky creatures!

I never took time to finish the HellFire Warrior Series.

Anyone still have some of these in original condition?

OK, start with BASIC. The recommended
'Your Atari Computer' by Poole and McNiff
has a really useful listing of all the Atari BASIC
commands, at the end of the book.
The first few chapters give you easy programming examples.
I remember my first program was from that book, did a marquee type ASCII
graphics.
You can do just about anything with Atari
BASIC. Lots of people use it, even for commercial programs, which is
sometimes
compiled. You can get the game going,
then use BASIC machine code USR routines
for parts that are slow.
Just starting out, it is fun to just write a
'Hello World' program:
10 ? "Birdie3 ";
20 GOTO 10

Luck

There's a few that don't seem to have been converted and cracked. Crime
Busters, and Commando for instance, (as far as I know.)

Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Try looking through this list...

http://www.myatari.com/bc800d.txt

If it's listed they should have it. Good luck.

I think a black and silver model would be cool. I always thought the
XL series looked the coolest and the 800xl seemed to represent the
8bits to me back in the day, altho I always like the 1200xl the best
(and still do) cosmetically.

Further to my last post, thanks for the help, I gather this is what I need,
are they still available does anyone know ? Or are there any plans out there
?

Thanks

IIRC it was Paul Alhart who published a neat and cheap alternative in
AIM magazine way back when. You lay two SIO cables side by side and
strip about a foot of cover off each one, starting about 8 inches from
the paired ends, uncovering towards the center. You then bunch the
foot of uncovered wire together so as to expose/create a large ball of
wires on each cable. You then find and combine each color of wire with
a few tight twists. Then at each twist, you apply a soldering iron to
melt away the insulation, apply some flux and then solder the same
colored wires together. Make these connections all along the way of
the bared one foot of wire such that no connection can touch any other.

Tape each connection with electrical tape, then tape the whole bundle leaving out the ground wires. I cut the ground wires in the middle and fold them back to then wrap the main portion with aluminum foil and integrate the ground wires into the foil on top and soldered back together followed up with a good wrapping of tape.

You can't beat the price or availablity. The utility of such a four headed cable will amaze you once it's built. Use the two short ends (8 inches) for your disk drives with the long ones used for your computer and Atari printer. You now have three open ports to link everything else with.

The only problem is when the color of the wires are not the same, I never ran into that situation though. Chances are good they will be matched which is something you should double check before soldering the first wire?

I was in need of just such a critter when I got that AIM issue, thanks Paul, you saved the day. It's a bit more work than it sounds, but it's well worth doing.

If anyone has any luck getting in contact with him, please let me know. I
have sent a couple queries over the past months for information about the
products, and I have yet to receive a reply.

thanks

I was going through my old stuff and came across my original Atari 800
Rev A ROMs! So I put them back into my 800 (orginal owner since 1979)
and made a quick dump using Action! What I have is OS Rev A, the

North American NTSC version, which I understand is quite rare. At least
the dump is rare.

The ROM image seems to work fine in Atari++ (1.44 for Windows) and
Atari800Win Plus 4.0 Final, though the latter complains about the
checksum (proabably because NTSC Rev A was unknown until now).

If you are developer (or just want the ROM image) just Email me and
I'll get it to you. Please use the subject, "800 OS A".

My Email address is pretty easy to figure out from the message headers.

Yeah I want one too. It would be great if they want into production. Is this
the same guy that made the portable Atari 2600 that was shown at one of the
CGE in Vegas? I was there and saw it. It looked super and ran like a dream.

I find that a800winplus 3.1 is more stable than
the final 4.0 version, at least on my XP computer, Win98SE seems to like 4.0
fine.
Anyone find instablility in 4.0?

I'm a Win98SE user.

I found 3.1 slightly more stable than 4.0 Final. I did have problems
with saved states and one of the 4.0 betas but I can't say which one.
No apparent such problems with 4.0 final, but then again I haven't
played many games, and therefore haven't saved many states, since going
to 4.0.

OT:
I can't change the color saturation from within 4.0. I can change the
value within the Pallette menu but nothing actually changes.

I can't load a binary file from the H: drives using MyDOS (vers. 4.53/3
or 3.19). I can using any other DOS.

I believe that's a burl finish which is classy (IMO). Woodgrain (you
know with lines) is tacky.

I wish all laptops had this much style.

Amazing craftmanship!

Thanks for the info. Will raid the piggy bank, order/get bot POKEY and
PIA, and post
results when I am able. I get paid bi-weekly so nobody hold their
breath.

Thanks again,
                    Tarkin

Wilson gets 37 months for porn charges

Date: November 3, 2005
Publication: Herald & Review (Decatur, IL)
Page: A3

URBANA - Travis Wilson, 28, of Decatur was sentenced Monday to 37 months in prison by Chief U.S. District Judge Michael P. McCuskey in U=2ES. District Court, Urbana, after he pleaded guilty to possessing child pornography. Wilson also received three years supervised release,

was required to submit to a DNA collection and must register as a sex offender.

Charges were filed after an investigation by the U.S. Bureau of Immigration and Customs Enforcement, Decatur Police Department...

Decatur man arrested in child porn investigation

Date: May 28, 2005
Publication: Herald & Review (Decatur, IL)
Page: A3

DECATUR - Bond was set at $75,000 on Friday for a 45-year-old Decatur man arrested a day earlier by local and federal authorities for investigation of possession of child pornography and disseminating it via U.S. mail and the Internet. The suspect remained in the Macon County Jail late Friday afternoon. Formal charges have not been filed.

Decatur police were proceeding with the case against the suspect, but federal authorities could decide to step in and take over the case for...

Yep, voice and modem circuits. From what I recall now when I looked into it
there were differences with the way the Black Box / MIO used the $D6FF
memory location than the Atari parallel bus devices.

Atari had used specific bits at that address to enable the mapping in the
code for specific parallel devices in the $D800 - $DFFF region. Since these
devices were only unique to the 1400XL / 1450XLD / 1090XL and were not
marketed then the makes of the Black Box and MIO made use of the $D6FF
region for their own use.

Huge bus conflict occurs when trying to use the Black Box with a 1400XL and
1450XLD.

I may try that, thanks for all the help, could I just use 4 SIO sockets from
old dead Ataris, and connect them all together vis short junper cables ? Are
there any drawbacks with this ?

Thanks again

Richard

CSS had both a regular and deluxe (switched) Quintopus. The switched
Quintopus is very handy if you have some incompatible hardware on the
SIO chain. And you might also check at B&C ComputerVisions -- IIRC,
they sold a couple of multi-port SIO attachments, and one of them could
be powered. -Larry

A very popular feature of the MIO was the 256KB/1MB ram for ramdisk(s),
etc. But according to the docs, the KMK-JZ interface will control two
IDE devices -- a Master and Slave. Has anyone set one up with a
regular drive as the Master and a compactflash as the Slave? This
would pretty well simulate the MIO interface + ram feature, especially
since the CF is non-volatile. Has anyone timed a compact flash with
this interface to compare against the MIO ramdisk? -Larry

   The transfer of the assets is nearing completion. I am awaiting the
final two packages to arrive within the next two weeks. I am the new
owner of 8-BIT DESIGNS and C64DIEHARDS!
 I am hoping to get involved with the ATARI COMMUNITY here and learn
more about how I can offer support in this area.
 Please feel free to drop me a line sometime with suggestions.
 I will make an other post once all is finalized!

 Charles

Hi,

It has been over 15 years since I last used an atari (ran a BBS in AK
with an 800 and 4 drives daisy chained to it for about 3 years). At one
time I had a 400 (which I used for modeming out), an 800 running a 24
hour BBS, a 600xl and a 1200xl that I used for programming / playing
games on. I have been tinkering with the emulator Atari800Win, but
recently all my old 8bits have been my 1st computer I owned, the little
Timex Sinclair 1000 (host a support site for it at www.ts1000.us).

I have been trying to remember a program I had at the time that gave
you 80 columns of text on the 8bit using Graphics 8 that you could use
with your basic programs. Does anyone know what the software name was?

Bill H

IMO the 1-chip 14C89 SIO2PC is the easiest to make (see link).   It's not compatible with my SWP ATR-8000 but it works great with my PC using Hias Reichl's AtariSIO.

My 14C89 SIO2PC interface is built inside my 800XL. I've also built an external interface based around the MAX-233CPP IC. It was also easy to build (relatively for a NOOB like me) but it has about 8 more solder points than the 14C89 model.

Steve Sheppard

I remember one called col80.obj or .com.
There is a col80.arc around that contains the
executable and a doc file, I think.

Hi,

Please forgive me if this is seen as spam or if you've seen this before, but
I thought people here would be interested.

I have printed and produced some classic computer wall calendars for 2006.
You can see it and purchase them online at:
http://www.digicraft.com.au/calendars.

The calendar features the Atari 800XL.

Greetings,

There are quite a few DOS replacements for the Atari 8-bits.

I was looking thru some stuff and found a TOP DOS 1.5 Disk and
Original Manual. Looks fairly good.

How does this DOS stackup as a replacement for DOS 2.5 over
other replacements?

Also, in my disk collection I found a Original Disk labled,
SMARTDOS release 6.1D.

No manual that I know of, unless on disk. Anyone know
anything about this one and if it is any good?

Sounds interesting. Can you have more than one setup to simulate
more than one RamDisk?

Using a MIO on a 130XE, you can have Several RamDisks at the
same time, including the 130XE RamDisk. Especially with the One
Meg Version.

For example, with a 1meg MIO, you could easily have 4, 200K
RamDisks, a 5th one if using a 130XE type RamDisk and still
have enough memory for a good MIO printer Spooler.

All would be reset proof except for the 130XE ramdisk.
And if you can get along with less memory for ramdisks,
more are possible on the MIO.

The MIO RamDisk is almost like a mini hard drive.

When running a BBS, it is possible to load all the BBS commands
and etc into a RamDisk instead of putting them on a hard drive.

I had BBS Express Pro setup like this, using SpartaDos 3.2D.

When these commands are accessed by users, they load up as
fast or faster than off a hard drive and it saves ware on the Hard
Drives,
because they are loading up from RAM and Not having the hard drive
always accessed for common commands and etc.
Almost the whole BBS could be Ran in a RAM Disk.
Of course you will want to put your large files for downloading on the
Hard Drive. But you could put quite a few small 8-bit utility files,
text files and etc on a RamDisk for running and or downloading.

BTW, What would be the limit of Memory one could put in a MIO type
hardware device for use with RamDisks?

And what would be the size limit of a RamDisk?
I'm thinking this would be related to the Hard Drive partition size?

Could one make a hardware Ramdisk system like the MIO with a total
of say 8megs, and create 4 or 5 1meg RamDisks?
I think its possible myself.

And, Can the Memory in the MIO itself be upgraded to 4megs or more
and work without any software changes to the MIO?

At the time the MIO was made, Memory was very expensive. Now
its rather cheap. I'd love to be able to expand the MIOs Memory for
larger RamDisks.

Don't know TopDOS. I used SmartDOS as my
first DOS, I had to buy it from RANA, to go with
my RANA 1000 disk drive, my first drive.
It is an excellent DOS 2/2.5 compatible DOS,
but double density.
Today, I'd say MyDOS 4.53 or SpartaDOS 3.2g
are the most used. Sparta is not DOS 2/Menu
type, no DUP.SYS, it is command line driven.
Actually 3.2g isn't SpartDOS, it is FTe DOS,
released after FTe bought ICD rights.
The ultimate DOS, I would say, is SpartaDOS
X, which comes in a pass thru cart. I don't
like X, it seems to mess up my disks with its'
ultraspeed.

(Forgive the 'snip'.)
I don't think you can upgrade a MIO's memory.
Neither the 256K to 1 meg nor the 1 meg to
higher. The memory the MIOs used wasn't
PC, cheap type, but an odd type that was
expensive and probably not easy to find today.
I loved my MIO, also ran a BBS.
I could boot off it, in fact, I had it set up
to re-install BBS Express on power up, if
there was a power outage, using Sparta 3.2D
batch file.

Hi there.

I want to give CC65 a try but since I have used only Basic to develop
on A8s, I have no idea how to do memory management.
What do I have to do to calculate the free memory for CC65 programs.

Bye Jochen

I really like Top Dos. I use it when programming mostly, as I just type Q do
and the do batfile contains all the programs I want to start in sequence. It
starts first with Textpro, then AMAC, then any fonts, music and such to end
with my assembled file. Really nice, so I don't have to type L TEXTPRO, L
AMAC, L FONT1.OBJ and so on!

Doesn't support Harddrives though, unless you keep it to DD, which I have
found works okay.

 Does anyone out there have an Atari 1200 XL either for sale, trade, or
BETTER YET, DONATION?? I need 1 to develop, test, produce, and market
my "NEW" products.

Thanks

Ramswell

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

You setup the memory configuration of your program via the linker config
script. You can set the start address of your program and setup the
various code and data segments. There is a default linker configuration
script that you get when you compile with the -t atari switch that places
your program at $2E00. The short story is that you don't need to do any
memory management for simple programs. There is many ways to reserve
memory for your program to use, but I'd say the best is to use the linker
configuration script and/or defining the structures/arrays explicitly in
your program.

The top of memory is calculated based on MEMTOP/APPMHI and the C stack is
put directly under this (minus any memory reserverd for graphics modes) and
grows downward towards the end of your program.

More information can be found in the documentation at www.cc65.org,
specifically in the section on ld65 (the linker) and the platform specific
documentation for the atari.

Well, I should have mentioned the fact, that I meant the original CC65
on the A8 itself.

Bye Jochen

I think that the characters were only 3 or 4 pixels wide - but may be
wrong.

Back in my atari BBS days I had a non atari drive, not sure what brand
it was. It had an led display on it that showed which track (or sector)
it was accessing. The nice thing about this drive was that it had a
standard floppy connector on the back that I was able to daisy chain to
two 5 1/4 drives I salvaged from a cp/m system I had and to a drive for
an Adam computer that I popped open and removed the controller on. I
think the software I ran was FoRem (?). I also used another software
(BBS Kit?) that let you build your bbs based on "scripts". In it's
heyday I was averaging 30 - 40 callers a day (not bad for a BBS that
was just messages). Eventually that dropped to only a few calls a day
when my ex-wife discoverd how to answer the chat (one of the reasons
she is the ex :)). One day I got so tired of it I pulled the board
down, plugged a dumb terminal into the auto answer modem and just let
her chat with any caller!

Pretty much anything that is tangible has intrinsic value. Corn and pork bellies have intrinsic value. What does intrinsic value mean? Intrinsic value means that something will never have a value of or less than zero.

Stocks, for example, have no intrinsic value. You pay for part ownership in a company through the purchase of stock. Unfortunately, stocks do not have intrinsic value. Therefore, what was worth so much money one day, could be worth literally nothing the next day.

Commodities, however, have intrinsic value. Gold has intrinsic value. Gold will always be worth something greater than zero. Why? Because it's tangible and people can actually hold it and do something with it. Gold costs money to mine. Real work goes into mining and processing gold for consumption and use. This means that gold will always have real or intrinsic value.

While a product like the MIO may have some intrinsic value, many of these devices end up on landfills because their real intrinsic value is virtually zero. Again, not literally zero, but, virtually zero. The simple fact that there is a small group of diehard collectors out there, does not give such devices any real intrinsic value.

But yeah, they do have more intrinsic value than say, a stock certificate. ;)

>

Speaking of intrinsic value, I went straight from posting that last message,
to reading a spam message from Bravo Sierra Computers. As you know, most of
the products that Ben sells, he probably gets for free. i.e. the donors
have deemed these products to have little or no intrinsic value. The basis
for this valuation is the very real lack of demand for these products. It
pretty much is not feasible to produce these products any longer.

While they have real, or intrinsic value, the intrinsic value of these
products is virtually zero. Do not confuse "collector value" with
"intrinsic value" because they are entirely different. Intrinsic value is
the real value of the product... and the intrinsic value of MIO is
virtually nothing. The collector value of the MIO might be significant, but
it in no way represents the real or intrinsic value of the item.

Yes, I know! You're confusing "intrinsic value" with "collector value".
Take a dollar bill, for example. It's face value is equal to an arbitrary
value of one dollar - or one hundred cents. Its real value is substantially
less. A dollar bill has an intrinsic value of almost nothing, but an
arbitrary value of one dollar. But what's a dollar worth?

As for stock certificates, remember the dot com bubble that burst not too long ago? That was only able to happen because the stocks of those companies had no intrinsic value. They had no real value. Stocks are bought and sold on speculation and illusion. They have no intrinsic value.

Ever wonder how the wealth of a nation can be greater than its tangible assets? It's all about intrinsic value and perceived value. Collectors buy based on perceived value.

Take antiques for example. The intrinsic value of antique furniture is virtually nothing - The raw materials have some intrinsic value, but the actual antique has virtually no intrinsic value. People make money on antiques because they can get items with little intrinsic value and sell them at a much higher perceived value.

Two entirely different animals...

Thanks for this!

Is there any simple way of using the extra paged memory (of a 130XE or
expanded 800XL)?

Can I feed an 2.5' hdd from the PSU of an 1050 drive. My plan is to
install a HDD in the 1050's case. If yes, then can anybody tell the
pinout of the power connector? I don't even know if 5V is available,
but my hope is the yes.

> I have been trying to remember a program I had at the time that gave
you 80 columns of text on the 8bit using Graphics 8 that you could use
with your basic programs. Does anyone know what the software name was?
<

There have been a number of these, implemented in several different
forms. COL80 was the first that I recall, published in COMPUTE! maybe
around 1982-83. There was a follow-up called COL80XL, since the
original was incompatible with the XL/XE lines. Omniview and the XL/XE
series of these came next which were replacement 800 operating systems
with 80-column drivers built in. Antic published one called EASY80,
which was quite good. There were the ACE-80 and ACE80-XL carts that
perhaps were the best overall implementations. There was also German
(I think) package called SAM (Screen Aided Management). All of these
have issues of legibility and speed to varying degrees.

Last, there is evidently an excellent 64 column driver/set. I've seen
the results, but don't know any details about it or if/where it can be
found. (Anybody?) 64 columns have some definite advantages over 80
columns -- mostly the character set looks quite nice, rather than the
"three dots + a space" characters in the 80-column sets. -Larry

No, you are taking things out of context to make a point not related to
my original statement. I never said the MIO lacked intrinsic value which

is what you went on about. Quite the opposite I made the point that has value to the collector. I didn't say the new stuff has no intrinsic value without qualifying the statement. I specifically qualified the statement by referring "to a collector."

It is like saying a new bag of golf clubs have no intrinsic value to a cat. That is not the same thing as saying golf clubs have no intrinsic value. It is a logical construct of subset vs. set, i.e. mammals vs. felines, perfectly valid.

I am sure it was one of the ones you mentioned but I seem to recall the
one I used as on bbs's as N80COL .BIN or .COM. I copied/appended it to a
compiled terminal program I wrote back in the 80s. Worked OK but not a
lot of features and a bit slow. Eventually I wrote my own screen
routines in Action! to get the speed up a bit.

I remember this too but I don't think I ever got it to work. Wasn't
there some constraints on the program where it would only run with
certain software? Something like TextWiz or a terminal program?

I thought a 64 column display would be nice too. I figured the actual
text on a printed page is only ~65 columns wide so it would be
good'nuff. I started writing a terminal program for a proportional front
but when it got time to make a proportional front character set I fell
flat on my face. I'm just not an artist, no sense of style. I never got
the combinations of little letters like 'i to look appropriate with big
letters like 'G so I abandoned the project.

There are no built in functions or anything like that. I have written some
basic functions to detect and swap in the memory areas, but you have to
carefully build your linker.cfg file and layout your segments so that any
code that is going to swap out a bank of memory doesn't reside in that bank
of memory itself, or depend on anything in that bank of memory.

There is some documentation on the www.cc65.org site in the Atari platform
specific docs on how to do this with the linker.cfg script and some code.

You could build wrappers for your functions that swap the memory out and
then call the "real" function in the extended memory area. I've never done
that myself, but it shouldn't pose any real problems.

I'm obviously wasting my time trying to explain this to you; I don't think
you'll ever grasp the concept here.

How much is a dollar worth? Do you know? Has anybody ever suggested that
you needed to learn the "value of a dollar"?

A dollar has no intrinsic value. A dollar has an arbitrary value that is
determined by international speculation and trading. Let me give you an
example of just how insane world economics is.

Both Canada and the United States each use the "Dollar" as their official
currency. In the United States, the dollar is equal to 100 cents. In
Canada, the dollar is equal to 100 cents. Can we both agree on that?
That's pretty simple, right? A dollar is a dollar dollar, and they're both
worth 100 cents.

Is the Canadian dollar and the American dollar equal? No! They're not, are
they? Without actually checking current exchange rates, I'll set a
hypothetical exchange rate of 80 cents on the American dollar. So, a
Canadian dollar, for the purposes of this example is worth only 80 American
cents.

It looks something like this:

One Canadian dollar equals eighty American cents.

So how much is a dollar worth? Well, to answer that question, you're going
to have to ask how much a cent is worth. How much is a Canadian penny
worth? Ya know something? A Canadian penny and an American penny are
equal. One cent is one cent -- no matter how you slice it.

So it looks like this:

One Canadian penny is equal to one American penny.
Both the American and Candian dollar are equal to 100 cents.
The Canadian dollar is equal to 80 American cents.

Doesn't make sense, does it? Nothing in economics makes sense. That's why no one understands economics and every economist disagree's with every other economist.

Lets expand this even more. How much is a dollar worth?

If I go to the convenience store on the corner, I can buy one can of Coca-Cola for exactly one Dollar. Therefore, my dollar is worth one can of Coca-Cola.

If I go a little further down the street, I can get a can of Coca-Cola out of the vending machine for 50 cents. Therefore, my dollar is worth two cans of Coca-Cola.

In theory, I should be able to buy two cans of Coca-Cola from the vending machine for a grand total of one dollar, and trade them in at the convenience store for two dollars. Right? The convenience store owner has arbitrarily determined that a can of Coca-Cola has a value of one dollar, while the vending machine owner has determined that the same can of Coca-Cola has an arbitrary value of just 50 cents.

So, what is the value of a dollar? What is the intrinsic value of the dollar? The dollar really has no intrinsic value, does it?

What is the intrinsic value of a can of Coca-Cola?

Well, let's pretend that it costs the Coca-Cola company exactly 7 cents to produce one can of Coca Cola. Well, if it costs the Coca-Cola company exactly 7 cents to produce one can of Coca-Cola, it can be said that the can of Coca-Cola has a real, or intrinsic, value of seven cents. Why? Because that can of Coca-Cola can not exist for less than 7 cents.

If the convenience store owner sells that 7 cent can of Coca-Cola for one dollar, and you buy it for one dollar, does that mean that the can of Coca-Cola has an intrinsic value of one dollar? Absolutely not! The intrinsic value of the can of Coca-Cola remains 7 cents -- Even if you pay a dollar for it!

That is the first 'almost correct' statement you have made. I understand
your explaination perfectly. It is just that it is out of context, as
such in error, and lacks relevance to my point. I understand concepts
like alien abduction, I just don't believe they are valid.

I was one of those people. Bob doesn't often take the time to answer
his email. But if you call him, he is very friendly.

FYI -- if you have thought about trying a CF "drive" with one of the
IDE adapters, you might check your local Kroger store. Our local
stores have 32 MB Sandisk CF cards for $4.99. Not big, but these will
be my non-volatile "ramdisks" for my setup. Cheapest price I've seen
by far for new cards. Let's see -- milk, bread, eggs, CF, ... :-)

It seems there's something of a storyline concerning the second software title
included in the CX481 The Entertainer kit. I've just updated the FAQ about it
like this:

CX481 The Entertainer (Star Raiders + (Computer Chess or Missile Command or
      Pac-Man) + 2 joysticks). Atari computer product catalogs first mention
      Missile Command, then Pac-Man as the second game. Text on the box
      itself (thanks Bill Demian) indicates Computer Chess as the second
      game. The illustration on the box actually shows a Music Composer box
      underneath the Star Raiders box.

I was just wondering if anyone knows any further details. What was the 2nd
title that came with your The Entertainer kit? Did it match the 2nd title
mentioned on your Entertainer box? Did any Entertainer kits actually come
with Computer Chess (seems possible to me), or even Music Composer (I highly
doubt it)?

Thanks,

-Michael

:(
No Kroger Supermarket in the Northeast (USA) Looks like midwest and
southeast plus Texas only..

Cheapest I've seen around here for 32MB CF cards is about $15.

Q: Does Compact Flash have unlimited read cycles?

Virtually, yes. Sandisk CF cards also do error
correction within when bits have been written to
beyond their limits, so as long as they are not
filled to capacity, they should write for quite
a long time as well. Actually, they have spare
bits, which is why they don't format to full size.

    I like how on the video he made he picks up a current compaq computer off the desk and he says "What is this?" and appears to toss it to the side where you hear a crashing sound. Then he puts down the XEGS laptop and says "Now THIS is a laptop".

    Wonder what the battery life is like on that laptop?

Well 80 column anything...

Currently using Ice-T 2.72 on the 800xl (ramboed) and that is really nice.
There were 80 column cards for the Atari 800. The Franklin card and I believe there was 80 column editor by Omnimon.

I also have a 80 column reader. If you have the XEP-80 module you get 80 columns on another display. You could use that at 4800 buad with bobterm, and other allication (accounting, etc)

Or just work at it normally on the Atari computer and see the 80 column effect when you print it on the printer. That is what I did back in the day. :)

And here is where I realize my fandom of retro computers. Some men have woman pinups, others cars, other sports, and others aircraft.

And I am thinking of the retro computer pinup calendar. LOL.. kewl.

Hey Doc! Yeah, I would have picked one of those up for sure. :-)

--
_/_/_/

None that I know of. Just checked the board and its up/online.

What kind of message did you get? If it was "connection refused" then its probably because of one of 2 things:

1. Another user is online (unfortunately, the software is single caller).
2. Its the top of the hour, when a script runs and checks if maintenance has been done in the last 24 hours. If it has, it goes right back to the online status. About 30 seconds or so. If its after 12am, and maintenance has not been done, then one of several scripts may run, depending on whether or not its time for daily, weekly, or monthly maintenance. Worst case, it might be 15-20mins. Thats why it runs after midnight, when caller volume is the lowest.

If you get a "cannot connect to blah, blah, blah" then the BBS is probably down, or offline while that lazy good-for-nothing Sysop is fiddling with something. :-)

There are still several around. I'm not exactly sure which one you are
talking about but here are a couple out "west":

http://www.best-electronics-ca.com/

http://www.aracnet.com/~atari/

HTHs. :-)

Hmm, between Brad and Ben, what Atari stuff did you have in mind that they
didn't have?

Or were you actually talking Atari hardware/software at all? :-)

The MAE assembler had an option to display in 64 columns, that's the
only 64 column display I've ever ran across. I assume one would have
wrestle that code out of there in order to use it outside of the MAE
environment, but I haven't run MAE enough to know either way for sure.
IIRC it was a LOT more readable than IceT's 80 columns but since then
I've graduated to a monitor cable so even IceT might be readable these
days. My problem with MAE is that it takes over your expanded memory
for it's own use when you want it set up with the bells and whistles
and I want that memory for my ramdisk only.

The pages look different, but that may be them..

Either way, its another source for stuff :) Ive about given up on ebay
(between the stupid prices and getting screwed).. And the local area has
dried up totally.

This site came up in my "googling" search

http://www.vintagefunworld.com/

I know nothing about this vendor but perhaps it's the one you are
seeking. Vintagefunworld claims Anacortes, Washington as its home.

Regards,

Steve Sheppard

wow, thats it.. now why couldn't i find it via google... grrr..

I have the same trouble with Microsoft's technet. Cant find a damned thing,
but my programmer gets hits all day long..

tks!

I bought this new keyboard for my Commodore 64 because the last one
quit working. It was previously repaired by some one when the screen
went black trying to use it who told us that the "gaming chip"
(assuming that there is only one- pretty general description or not I
don't know) had burned out. When it happened again the same guy tried
charging us double and wouldn't give us the keyboard back without
giving him $50 for his troubles of just looking. I have since grown up
and wanted to revive my favorite all time system. I went on Ebay and
foolishly bought a the aforementioned keyboard that had no guarantee of
working. The same problem exists after trying the keyboard with two
different monitors and disk drives. My questions being:
Did I get screwed on the deal? What exactly could be wrong? Is it
possible to fix without buying another keyboard for replacement parts?

To whoever is willing to help thank you from the bottom of my video game loving heart (i mean come on, this system was how I learned to play cribbage) and if there is any extra details about the situation that could help you figure out what's wrong let me know what you don't get. Again thanks to anyone who can offer any help.

True, but the MIO is really a nice piece of hardware and the 1 Meg
version allows alot
of options with RamDisks and Printer Spoolers and is Reset Proof. If
your 8-bit crashes,
99% of the time anything in the MIO RamDisk(s) is/are safe and you just
have to reboot the computer.
Plus you get a built in printer port and RS232 port which goes up to
19200 Baud.
Not Fast compared to todays computers, but in the day it flew.
And of couse the 50 pin Hard Disk port.

Maybe not as good as the Black Box Hard Disk system, but it works well if you get the right drives.
You can have alot of room for a BBS even with the partition limit.
That's another thing I'd like to see a upgrade for.

The SDX cart and the MIO are a great combination. Disk Based Sparta also is very good with
the MIO.

I'd like to see a hardware upgrade to increase the RS232 Port speed and maybe add a Flow
Control Option. As the MIO doesn't use Flow Control and must be turned off when using most
modems.

Still thats a high price, It almost tempts me to put mine up on E-Bay, As I have the exact hardware
that was up there for sale.

But to me as a collector and user, I can't bring myself to sell the 1meg MIO, it adds alot of
extra power and fun to an 8-bit.

I did end up buying a SDX cart and manual off of E-Bay and paid pretty much the going rate which
is around what it costed New way back. I have 2 SDX carts now. A few months ago I had none and
couldn't get one anywhere.

I'd like to see the MIO re-made with some good upgrades. Or a similar product.
Take the best of the MIO and Black Box and throw in a major speed upgrade and some
good chips to program. A few USB ports for add on hardware. It would be cool. And
would probably sell quite a few units.

Hrm, if noone here answers (since this is an Atari 8-bit newsgroup),
you might want to try comp.sys.cbm (Commodore Business Machines),
since that's the main group for C=64 folks. ;^)

Good luck!

You'll find that if you'll replace your 6520 PIA with a 68B21 from
http://www.jdr.com for $2.89, it will start working again. The older
PIA's must have been a bit defective but that has fixed two 800s here
with your same exact same symptoms. I've never seen similar symptoms
on XLs or XEs - just 800s, a strange bit of business.

I hate to ruin your day chris, but NO computer ever had a "Gaming
Chip", so I take it the guy was taking you for a ride. There's a few
things you can try out yourself to narrow down where the problem is,
but if you've only limited electronics knowledge, there's not alot
you'll be able to repair yourself. Test 1: Is the power supply working?
Does the Power LED light. If so we can elliminate the power supply. 2.
Does the computer react in any way when turned on? A Beep or similar?
If it's beeping or reacting some other way, then it's most likely the
TV Modulator that's died. Test 3. Is the processor running. If you put
your ear to the bottom of a home computer, you can hear it working. Is
this the case, or is it completely lifeless? If it's completely
lifeless, it's probably the 5V regulator that has died. If you can hear
the computer, then it's back to the TV Modulator... I'd suggest you
seek out an electronic hobbyist in your area, who can probaly get it up
and running again. However, a lot of the Chips used in the C64 aren't
available anymore, so you may have to buy a second one for the spares
anyway.

Yes but...

I thought there was a hack for equivalent functionality like this,
something like a switch that hooks into the cartridge present pin and
machine does a 'someone pulled the cart' reboot w/o having to cycle the
power. Then it becomes a matter of making an internal memory upgrade
like a Newell 1meg or one of the SIMM ones.
> Plus you get a built in printer port and RS232 port which goes up to
> 19200 Baud.

I haven't used it in years but I seem to recall APE with a SIO2PC cable
lets you use a PC's modem and printer port. Probably results in a better
connection since you have 56k serial ports/modems with 11 byte buffers.
The 6551 as is used in the MIO only has something like a 2 byte buffer
so its less forgiving. Steve said you can even use a SIO2PC cable hooked
directly to a modem/PC serial port if you use the RVerter handler. I
don't recall the maximum speed of the RVerter handler but I would bet
~19k wouldn't be a major problem to add.
> Not Fast compared to todays computers, but in the day it flew.
> And of couse the 50 pin Hard Disk port.

I don't have a real problem with Scuzy drives, even own a few like a
Sequest removable media. I was under the impression that the MIO has
some problems with modern drives in that they won't format 256 byte
sectors. => forces you to a limited set of older drives.

Not that any of this is a real problem depending on where you live. I
live in the SF Bay area and there are surplus electronic shops with
racks/boxes of old drives for sale cheap.

Hehe, I was the one that loaned my SDX cart. It was 4.19 which doesn't
work well with SIO2PC software or fit in a 1200XL cart port so I seldom
used it.

I'm not the most up to date on rumors but the Atari clone VCS supposedly
  sold in the 100k's. I think Kurt Vendel was a major player in the
original and what will be a next generation device. I almost feel like
sending him a wish list of things I would like in it or be able to add.
Mostly I would like to see things added on silicon.

For instance sync timers registers so we could use a wider variety of
monitors. Right now if we modify clock speed we lose vertical sync and
the monitor goes nuts.

Faster dot clocking ANTIC and GTIA and the abiltiy to put more then 8k
of video memory on screen w/o having to resort to tricks. Eighty column
video text in B&W is good'nuff to get me interested in parting with $$$.
Anything else like a double res gr. 15 or a VGA monitor is a bonus.

While they are at it go with at least a 10 byte buffer in POKEY and
bring the connection out. Doesn't have to be much, just an edge card
type connection on the PC board so it doesn't add to cost.

I wouldn't need a faster processor if they would add the 65C02
instruction set as a minimum. I have one of these in an old 800 and in
my experience it can make ~5% tighter code. => an OS rewrite would mean
an extra 800 bytes of code available for enhancements. They would need
to use flash memory or an EPROM for it to work.

A second PIA chip an have it brought out as an IDE interface would be
nice. Once again just an edge card connector so the 10-20 they sell to
8-bitters doesn't get passed on to the thousands they sell to the
pedestrian users.

If anyone wants to "loan" me one of these, I'll gladly take it off your
hands. :)

    Uh, there is no "gaming" chip in the C64.

> When it happened again the same guy tried
> charging us double and wouldn't give us the keyboard back without
> giving him $50 for his troubles of just looking.

    Not a good guy.

> The same problem exists after trying the keyboard with two
> different monitors and disk drives. My questions being:
> Did I get screwed on the deal?

    Yes.

> What exactly could be wrong?

    There are many possible items that could go wrong in the C64.

> Is it possible to fix without buying another keyboard for replacement parts?

    It's possible, though with C64's going for so cheap, you'd really

have to love your current one to get it repaired for a price. To
demonstrate how cheap C= machines are, at our table at last weekend's
Vintage Computer Festival, we had C64's for $5 and C128's for $10.

Truly,
Robert Bernardo

Hi there,

if you're an old computer collector I'm sure you'll be interested in the =
(probably) largest old computer sale EVER. Over 570 old home computers =
are up for auction at www.mo5.com/dimitrisales/
All you need to do is register (it's free and done in 20 secs) and then =
you can start bidding. If you want to have a look at what's up for =
auction without registering, that's possible too of course, just click =
here then : =
http://www.mo5.com/dimitrisales/auctions.php?tri=3D4&limite=3D533
Some very very very rare items are up for auction, the most famous one =

probably being the Commodore 64 GOLD WITH commemorative plaque!!!
But there are many other fine items, if you're a collector, I'm sure =
you'll find them quickly enough   :)

Right now, 145+ collectors are already bidding...so don't hesitate or =
you'll be too late!=20
ALL AUCTIONS END DECEMBER 4TH 2005

Oh...if you want to see pictures of the collection, go here : =
http://users.pandora.be/F-242/Computers/NewPics-25-10-05/
And if you want to see the complete list with direct links to these pics =
(not all comps have a pic yet) go here : =
http://users.pandora.be/F-242/Computers/Computer-List-Dimitri-with-pictur=
e-links.htm

That's about it...good luck if you intend to bid.

Dimitri Kokken,
Belgium

I was considering the idea of combining some of the items into a more or
less complete system, maybe including some old PD software.
Set someone up with the ability to put the machine together, hook it to
a TV, and play some disk-based games right out of the box, for example.

In any case, this project has to go on the back burner for a while.
Personal issues have risen, and I must spend my time dealing with them.
Maybe after the first of the year...

Hi,

I've just picked up a boxed Atari400 (UK PAL) from a carboot sale here in the UK.

Switching the unit on give a 'Atari Computer - Memo Pad' and a block cursor prompt.

Does it need a Basic Cartridge or is Basic built in on ROM? What commands are available from this prompt? The computer came with an Atari 400/800 Basic Reference Manual but no User manual. Is there a copy of the User Manual online?

Can anybody give me some indication of what it's value would be? I'm not indending selling it. I plan to make some use of it for a while.

Any info greatfully received.

Cheers

Hi!

Memo Pad has no commands available. You do need the Basic Cartridge.

Not too sure about the value of the manual. I have Basic cartridges to spare
if you are interested. Send me a couple of lines and we might agree on
something.

Take Atarian care

Hi Vidar,

I've just won a Basic cartridge on Ebay on a 'Buy It Now' so I'm pretty well sorted on that now thanks.

As regards the valuation, I was after a valuation for the boxed 400 and not the manual. After re-reading what I wrote earlier I can see why you thought I was after a valuation for the manual. My fault.

Cheers

TheDysk

Wow.

Hi Dysk!

Is the Atari 400 not with four Joystick ports?

Best Regards,

Daniel Mandic

Hello world.

I'm looking for someone that successfully browsed the Internet using
Contiki in his/her 8-bit Atari.

I already did it, but it was hard to find a good SLIP/routing
configuration on my linux box, and I'm trying a more simple config.

Did someone try conecting the 850 to a Windows PC with SLIP and routing
enabled? Which version of Windows and/or programs were used?

Thanks in advance.

Hi, Yes it has the four joystick ports along the front, just below the
membrane keyboard.

Cheers

The fatal flaw would probably be that you need to cmp #$01. What your
code does is compare against the contents of zero-page locations $01 and
$02. It's a common beginner's mistake, and not unheard of from
long-time 6502 (and 6800 and 6809) programmers, too.

LOL! Sometimes hard to track down too! Well, I never said I was an expert
assembly programmer! ;)

Hopefully the person who asked the question didn't use my code and jump off
a bridge in frustration when it didn't work!

Hey gang. For some odd reason I was thinking that you could buy Alternate
Reality the City/Dungeon on cartridge now. Is that not right? Like Ultima
3 and 4 from Atarimax?

I googled but couldn't seem to come up with the right combination of key
words.

Thanks!

Wrathchild was working on one, but I think it's been back-burnered for some
reason. Check AtariAge. There was a lengthy thread about it there.

a better link with more info just went up:

http://benheck.com/

it's actually made from a XEGS, I want one!

Very cool indeed! Would be nice if it had a Cartridge port on it. Also
would be really cool if it had the XE/ST gray look to it! The wood/brushed
is a little much IMHO.

BUT very cool indeed and amazing never the less! Great work!!!

true no cart port, but I guess being a XEGS it would be difficult
(since the cart is on top where the keyboard is. Also the XEGS doesnt
feature a PBI/ECI port, so that kind of expansion is out, but c'mon
you could load that baby up with almost every game for the 8bit and
take it anywhere!

Yea, grey or even silver/black like the 800xl would be cool.

Hey all. I am new to this group and I just to wanted to ask around and

see if anyone could direct me to the best learning resources to use for
developing games for the A8. I am starting completely from scratch so I
would need to learn quite a bit I assume. I have a few ideas and I
would like to give programming a try. Preferrably using 6502 assembly
language as opposed to basic. Thanks in advance!!

I suppose you're looking to go first rate by programming in assembler. If
you are new to
any type or programming, it would be difficult to use assembler. Since
Atari BASIC is
in your XL/XE computer, you could get started right away programming a

'Hello World' program
in five minutes.
Having the idea that you express for a game is, like, the strategic end of programming, and
the seed for where you want to go. Getting there might best be done in small steps.
I recommend 'Mapping the Atari' for lots of useful information. 'De Re Atari' is also useful.
A good way to learn would be reading ANALOG, and maybe Antic magazines, which had
source code in BASIC, and assembler.
Good Luck

Thanks for the responses thus far. I have been frequenting Atari Age
for quite some time now and I am also familiar with the books that were
mentioned. Basic probably is a good place to start for programming. I
have no idea. All I am really looking to do is to get some what good at
coding games for this system. I have a few ideas and I really want to
try my hand at programming. Does anyone know if there are books,
websites, etc.. that specifically cover this topic? I am looking for
study references that specifically cover coding games for the Atari
8-bit computers.

Good to see you found your way here. :) On atariarchives.org, you might
take a look at Atari Graphics and Arcade Game Design.

So every cartridge game is available for play also on disk?

I never thought of asking about that before.

yes altho not officially, every game ever put on cart can be loaded
from disk as well.

A female coworker of mine has a sister in the USA. So we checked out

the prices for flighing to the US from the Netherlands one day. We
found out that flighing to the USA and back is cheaper then flighing
from one city to the next within the USA.

So what's stopping 'ye? ;-)

Was there a voice chip or a modem in there? I seem to recall that
either of the two uses the same address range ($D6xx). For those to
work with the Blackbox you'ld have to make both willing to share those
addresses.

Hi
I am new to this so I hope I am in the right place, I have just got
hold of an Atari 800 all I get is a yellow screen on turning it on, can
anyone tell me what to do, is it repairable or is dead.

THANKS

> it be translated?

Heh, exactly as it is. else... if... :^)

I don't know 6502 assembly, but in C, you can convert this:

```
  if (a)
  {
    A();
  }
  else if (b)
```

```
  {
    B();
  }
```

to the more verbose:

```
  if (a)
  {
    A();
  }
  else
  {
    if (b)
    {
      B();
    }
  }
```

And convert this:

```
  if (a)
  {
    A();
  }
  else if (b)
  {
    B();
  }
  else if (c)
  {
    C();
  }
```

to this:

```
  if (a)
  {
    A();
  }
  else
  {
    if (b)
    {
      B();
    }
    else
    {
      if (c)
      {
        C();
      }
    }
```

```
  }
```

You can see why they came up with the "else if" construct in programming languages, huh? ;^)

> (2) 256K Rambo-enhanced 800XL's

I would figure those might get a bit of money but not as much as you would think. For example, here is a decked out xe system:

 http://tinyurl.com/ctpu9

This one sold for almost 90 dollars but it has a lot of add-ons.

> (2) stock 800XL's

10-20 dollars I would say.

> (1) US Doubler-ed 1050 drive

20-40 dollars?

> (1) Indus GT drive

Hmm.. The only one that closed was a nice complete one:
 http://tinyurl.com/cwh66
93 dollars.

I would guess then a standard non-boxed one with just the drive might close
for around 25-50 dollars depending on condition. (i bought one last week
for a dollar. :-))

> (2) stock 1050 drives

10-20 dollars?

> (1) Apeface printer interface

5-10 dollars (pretty much guessing here)

 (1) MPP printer interface

5-10 dollars (pretty much guessing here)

> (1) Atari numeric keypad (I forgot the number)

5-10 dollars

> (1) SX212 modem
have no idea but i don't see anyone wanting one unless they were trying tio
complete a collection or something.

> several joysticks and paddles.
Put them all into a lot unless you have something speical and sell as one
pile. You probably won't sell them individually very well.

Bingo, that was the trick. When I had taken my computer apart initally, i
moved the knob tr4ying to figure out why it wasn't booting properly.

Moved it a hair and colors are normal once again!

Actually I think your "lame diagnostic skills" really were on the money.
Ever since I left both of the 1200xls on over night and for a long peroid,
they have been acting pretty darned normal. Both of them actually were
suffering the weird sound fading effect but that has gone away during the
weekend.

I really don't need 2 working 1200XLs but i just hate having broken stuff.

Thomas 'twh' Havemeister <twh1@gmx.de>:

>I have serious problems to convert that to assembler. I playing around
>the whole day now. Most problems do I have with that "else if". How can
>it be translated?

```
     lda NUM1
     cmp $01   ; if NUM1 == 1 then foo
     beq foo
     cmp $02   ; else if NUM1 == 2 then bar
     beq bar
     jmp done

foo: do some stuff
     jmp done

bar: do some stuff
     jmp done

done:    more code
```

This is a simple way to do it. I'm no 6502 guru and maybe there's a better
way, or some fatal flaw, but this is how I would approach it being a
beginner to intermediate assembly coder.

Someone at the Vintage Computer Festival asked me if I'm familiar with
an add-on library (I assume for Atari BASIC) called -- to the best of his
recollection -- "Atari SuperGraphics 3D".

Has anyone heard of it? Got any info?

Thanks!

Hello all,
     In my travels I came across an Atari 800, w/ a 1050 drive and Epson printer (w/ interface)
The previous owner was having disk drive troubles, and not wnating to futz w/ it, upgraded
to a PC, relegating this treasure to the dump. I rescued it, and my quest begins....
     The 1050 appears to be OK. I bought another on ebay, and it appears to be ok, but
the 800 will not talk to either drive. I attached each, in their single-drive configurations, and
neither provokes any response from the 800. As I have the BASIC cart, typing DOS just
dumps me to the Memo Pad. I tried booting without the BASIC cart, more Memo Pad.
     Basic commands like STATUS, OPEN, and XIO give me ERROR 130.

     Does anyone have any suggestions, tips, routines, or other information concerning
the troubleshooting and repair of the SIO port for the 800?

Your help is greatly appreciated,
                                        Tarkin

I seem to recall having seen a way of making a "spider" SIO connection box,
does anyone else recall this, and are there any plans/details on the web.

thanks

Richard

bill@newbreedsoftware.com (William Kendrick) wrote:
> Has anyone heard of it? Got any info?
I remember it but not much. There were two version with increasing
'power'. It was both a 3D development environment and a bunch of routines
you could call from Basic. It might have been Antic published and possibly
Tom Hudson? Memory is failing..

I found this via Google:
              Product name: SuperGraphics
              3-D Display System & Game Tool (by Bill Budge)
              Language: called via PRINT "%..." from Applesoft
                   or Integer BASIC
              Hardware requirements: Required are an Apple II
                   with 48K of RAM and a minimum of 1 disk
drive.'
              Operating system requirements: DOS 3.3
              There was an Atari 800 version.

Also, someone was selling this a while back:
Supergraphics 3d ref. Manual by P.Lutus Kerby, 1980

It may be your SIO cable that's bad...don't rule that possibility out.

I had a bad POKEY recently. Sound and keyboard were okay, as was booting
from cassette, but no disc access and no saving to tape. As my machine was
an 800XL, upon booting it jump right into BASIC or Self Test.

Replaced the POKEY, no probs since.

Have you tried completely taking the computer apart and then pulling out and
then reseating all the socketed rom chips? Also might want to consider
doing that to the ram/rom cards as well.

The two different drives had two different cables as well.... I'll ohm
them out to rule them out. And I know at least one of them
has a good pin 4/GND and a good pin 10/+5v/RDY, as I tested that w/ an
LED.

Yes, I had tried to reseat all ROMs and cards....will do so again.

fsh had the info I was looking for, because, while my keyboard is
flaky, it's due to the previous owner being a touch-typist, and a fast
one
at that: all the most oft-used keys need extra force, although, after
30 mins of use, the keys become less in need of the hammer
treatment. But, the keys that are good have excellent, repeatable,
typematic delay and accompanying sound.....and the sound
commands work excellently, no distortion, clipping, or artifacts. So I
had ruled out the POKEY, thinking the SIO would not fail in
isolation. fsh has confirmed a suspicion of mine.....that it (SIO
portion of POKEY) will fail in isolation.

I will ring the cables, re-seat the chips and cards, and, if all is
still not well, order a POKEY.

Thank you all,
Tarkin

I need a monitor cable for my 65xe is there any problem with me using
a commodore 64 one? I used to have a cable that had 3 rca jacks
coming out of it (I foolishly gave it away with my ol 130xe) and I
read somewhere that the cable's work but the rca jacks correspond to
diff things depend on whether you use a c64 or xl/xe. Now I see alot
of cables with just audio and video and no extra rca, will they work
fine on my xe?

I use a commodore one on my 800XL, so I guess you could.

It should work fine, it's what I've got. I believe the extra cable is for
luma.

Hi Kevin!

I bought a cable from "BOEDER", a local accessoires-producer. On that
writes, that it is for ATARI XL , C64, and some more AFAIK. So it
should be the same cable for both.

I have used the cable in a Bread Bin C64 and a 800XL, honestly. The
Picture is well!!

Best Regards,

Daniel Mandic

Anybody see what the one meg MIO and Spartados X cart went for on eBay.Never
thought it would go that high. If these items can go for that much (I know
they are rare) why wouldn't someone re-release say the: Spartados X cart for
$50.00. I sure they would sell enough in the Atari community to make it
worth it. As for the MIO. the chips in it were expensive at the time it came
out but now one or two chips could do the same work for a lot less. Is my
thinking way off here or what?

My granddaughter lives with me and she is four years old. She wants to play
video games so I booted up MsPacman and she fell in love. What other Atari8
games would you guys remember that's not too hard to play and she could pick
up easy.

Winning bid: US $717.07

New stuff has no intrinsic value to a collector. The new stuff like IDE
and SIO2PC interfaces have much better performance and utility then the
old stuff yet they don't go for those kind of prices.

Yes, I had one original Atari DOS 2.0, and one original Atari DOS 2.5
disks, as well as various app disks which had DOS and AUTORUN.SYS on
them.
No response from either drive.

Have yet to get around to reseating the ROMs and chips; will post the
results. I wish someone would pay me to futz with old computers,
instead of the
manuals labor I perform. (I'm a handyman. Today was removing a 500lb
tub.)

Thanks,
         Tarkin

Okay, re-seated every IC I could lay my grimey fingers on-
even the ones underneath the plastic card-cage, and all the
chips on each 16K RAM card. Still no response from the
drives. Looks I'll do the POKEY next.

Thanks,
          Tarkin

A high quality fag in one's mouth can be both exhilarating and
refreshing. The experience is one of life's finer pleasures and I
highly recommend it.

Cheers!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Now that this auction is over and done with (with a bid of $1,635),
does anybody here now what became of the deal? Did the seller decide
this was an adequate price? Was the buyer active in this group? What
sort of wonderous treasures were extracted from this storage unit from
hell?

>video games so I booted up MsPacman and she fell in love. What other Atari8
>games would you guys remember that's not too hard to play and she could pick
>up easy.

My daughter plays:

Alf in the Color Caves
Alphabet Bee
Lode Runner
Dog Daze Deluxe
Ducks Ahoy!
Sesame Street: Letter-go-round
Big Birds Special Delivery

probaby some I'm forgetting too. I'm also interested in any "kids" games.

I always liked DonKey Kong and Donkey Kong Jr. My kids still love them and
they are teenagers. Frogger is another one.

Even with a DOS disk, the manuals say you might hear beeping,
and that this is completely normal. Also, the drive manuals
indicate that, with the BASIC cart installed, there will be a
slight pause before the 'READY' prompt. There is no such
pause. (Oh, and no beeps.)

I glossed over or neglegcted to mention that the printer
interface (and printer) would not respond to OPEN commands:
error 130 again. So, between the two different types of
peripherals, and the two different drives, I'm inclined to blame
the 800.

Thanks,
         Tarkin

I still say it's the POKEY. If you can't find one, you should consider
buying an Atari 7800 Ballblazer cart for cheap off of Ebay. They have a
POKEY inside. Needs a little desoldering, though.

Cheers from Germany,

Frank

I resserected my 800 for my niece (age 5-6 at the time) but that would
have been way back in 1986-1987. I can't remember any specific titles
that she liked, perhaps Womper Stomper.

You might try several of the titles from Spinnaker Software. I believe
they were oriented toward younger childeren. Educational games.

Oh someone in this newsgroup recently mentioned Pinhead.

do you really work at a zoo? do you get to clean cages and play with the
animals? can you pat them?

Bill,

The picture you have of the green screen connected to the blue computer is a Sol Computer. It was a 8080 processor based computer. That particular game was a fun one to play on that computer. I remember playing that back in 1978/1979.

http://www.vintage-computer.com/images/sol20.jpg

I wish I could've gone to the show myself, but I had to work the weekend of the show. Have yet to actually visit the Computer Musuem there in Mountain View.

It would be nice to know how to do this. I tried to use the Black Box with
my 1400XL years ago when I first got the Black Box (in 1992). But the
devices in the 1400XL compete for the parallel bus.

    The included SDX cartridge makes it a hot item. That typically goes for over
  $100 by itself on eBay. Still, if it goes over $300 I would consider it high
for those

items, even in nice condition.

True.. I agree that they can go bad.

I went ahead and tested it by hooking it up to another one of my 1200XLs and it works fine on that computer. Also checked the output with a multimeter and it looks like its reasonable.

I have a wide variety of floppy drives at my disposal. I have a few supras,
i think 4 or 5 indus gts, and several 1050s (no 810s though) and a XF551.

Is there anytyhing really useful or cool I can do with the xf551? I vaguely
remember seeing a webpage where you could mod a xf551 into a 3 1/2 inch
drive, is that still out there?

Hi All,
I'm looking for an old atari cartridge dump of a program called HamText.
If anyone has a copy of it, could you plase send it to me or let me know
where I can download it...

Thanks,
Jay

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

> Is there anytyhing really useful or cool I can do with the xf551? <

There are several nice upgrades:
The Bob Woolley 3-1/2" upgrade (also published in Antic magazine).
The CSS upgrades (plural) -- still available at last check at their web
site.
The HyperXF upgrade.

And also look at the most excellent Atari 8-bit FAQs.

William Kendrick <bill@newbreedsoftware.com> wrote:
> I'll once again be bringing my Atari 800XL, Atari Lynxes, and I think
> this year I'll bring my _old_, woodgrain Atari 2600. :^)

The woodgrain lives! It's a little fussy, so I might bring my Junior, too.
My Atari 800XL will be there, _alone!_ No laptop or SIO2PC cable. [*]
Everything'll be cartridge or coming off my 1.6GB HDD via MyIDE cart!

Sadly, I didn't have money/time to get the OS ROM upgrade chip for my 800XL,
so my MyIDE is still using RAM-under-OS-ROM, meaning there's a lot of cool
stuff I can't show off. (BOSS-X looked cool, but uses TurboBASIC XL.
Can't show most demos, the color JPEG decoder, etc.)

However, I did put the greyscale JPEG decoder and a bunch of JPEGs on the
16MB D2: partition I created, and filled a dozen Image partition slots
with disk images of games & demos that do work fine with MyIDE.

If you're in the SF Bay Area region of California, the event is this weekend
in Mountain View:

  http://www.vintage.org/

[*] Mostly because my wife is the one with the laptop, and she'll have it

    with her and will be out of town this year. :)

Well, you should still have Chroma and Luma, just no Composite.
That means you'd need an SVideo cable, or some-such...

I THINK. I'm not the expert in this field of Atari. ;)

If you need room under the hood, you could always remove the 9VAC to 5V
DC componets and run it off an external 5V computer supply.

"TRON" is a little 2-player game I wrote 20 years ago. This year, 2005, it
has been published on cartridge by Video 61.

The package comes in a box that includes the cartridge with a nice label,
along with an instructions sheet. (I wrote the instructions earlier this
year.)

The game itself is a very simple programming effort, yet I still think it's
quite fun. A classic genre.

Requires: a 48K 800/XL/XE computer and 2 joysticks.

Well I got home last night and plugged it in (no cartridge or anything else). I then turned it on and it worked (it has done that before after it sat for a whie, it would power up then not reboot after i tried cycling the power swtich).

I left it at the multicolored ATARI screen overnight. Woke up this morning and it still was at that ATARI screen. Background was red though, wondered why?

Rebooted the system. It booted up fine but I noticed that the blue screen with the cursor while it makes the funny whirring sound was a reddish color but it booted. It showed the atari screen with no problems.

I then shut it down and put a pacman cart into it. It booted up fine and the game played fine however the colors were off. It was like they were in the wrong cycle, not a color missing (by that I mean the screen looked fine and you could see the different colors, but it was like they were using the wrong colors, it wasn't a matter of a missing color as a problem with the cable).

The sound also was funny, it faded in and out while playing. I would hear the game then it would slowly fade to nothing and then the sound would fade back in.

I plugged the powerspupply and monitor cable into my other 1200xl and it worked perfectly again.

So before I left this morning for work, I went and plugged the problem child
1200xl back in and left it on the pacman demo and went to work.

Any ideas what still might be amiss?

Cuz there are none there. :)

I also see some other cart games I've never heard of
(e.g., "Clowns and Balloons", which sounds like either Circus Atari!
or Kickman), and they don't really have any add'l info... :^/

After 9 minutes (7 min?) "attract" mode kicks in, like it would in most
situations. However, since the rainbow color effect in the "ATARI" image
is a display list trick, the attract colors don't affect them... so, the
background changes colors, but the rainbow still looks rainbowy :^)

> Rebooted the system. It booted up fine but I noticed that the blue screen

Oh, hrm... so maybe NOT.

> wrong colors, it wasn't a matter of a missing color as a problem with the
> cable).

Oh, there's a POT (a little knob) underneath. I THINK you can access it
with the case still on. (Bob Woolley has had my Atari 1200XL for the past
20 or 30 years ;^))

It might need to get twisted. It should just affect the hues you see.

But then you go on to say...

> The sound also was funny, it faded in and out while playing. I would hear
> the game then it would slowly fade to nothing and then the sound would fade
> back in.

And my lame diagnostic skills won't help. :^) I'll let a smart person
answer.

Good luck!!!

The pdf files of the chip data sheets are no longer available at the Atari
Historical Society (after a site 'improvement').

However they are now available at:
http://www.retromicro.com/
(ANTIC CGIA GTIA POKEY only)

They are still huge and hard on the eyes, but you can always try
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL.htm

I need some cash and some room in my closet, so I'm considering selling some of my excess 8-bit stuff on Ebay. Before I go to the trouble, I'd like to know if it could be worth my while. I checked past Ebay sales, but I don't ever see many of these items. Could anybody give me a guess on what some of the following things might bring? All items will be in working order or they will NOT be put up for sale, and any needed power supplies and SIO cables will be included. None of these have the original boxes anymore.

(2) 256K Rambo-enhanced 800XL's
(2) stock 800XL's
(1) US Doubler-ed 1050 drive
(1) Indus GT drive
(2) stock 1050 drives
(1) Apeface printer interface
(1) MPP printer interface
(1) Atari numeric keypad (I forgot the number)
(1) SX212 modem
several joysticks and paddles.

Please note: I am not selling ALL my 8-bit stuff, just what I consider excess.

    Nice! I'll be comparing it to the Commodore JPEG decoder.

Well, sadly, I'll be stuck with only the greyscale decoder, since the
color one requires RAM-under-OS-ROM, which my stock MyIDE requires, as well.

If I were bringing a laptop to run SIO2PC (or, my god, a floppy drive!),
I could use that. But, for better or worse, I'm running entirely off HDD
this year. :^)

Good news, though... a coupla years ago I was playing with converting
videos from AVI/MPG/etc. into something the Atari could display natively
and relatively quickly.

I've got ~260 frames of low-rez greyscale video playing. I whipped up a
horribly lame player in BASIC tonight, and copied the ~750KB video onto
the hard disk. It loads each frame and plays it sequentially. It's pretty
low FPS, but still pretty cool.

One of these days I'm going to have to get one of Mr. Atari's videos onto
the HDD to play. I didn't have time to figure it out before VCF, though. :^/

>   Yup. Leaving in a few hours.

Cya tomorrow! (Man, I'm up WAY too late!)

Okay, that's Circus Atari (prev. to that, Circus in the arcade).
I actually wrote a clone of it for Linux, which has since appeared
on Windows, Mac OS X, and even Sega Dreamcast! ;)

  http://www.newbreedsoftware.com/circus-linux/

Kickman is a game I'd love to see on the Atari XL!

Yup, you would get some cash for couple of the items listed. All you
can do is list them and find out. If you don't want to sell them for
under a certain price, put a reserve.

If you consider selling the 800XL 256 upgraded one, I'd like to buy it! Let me know how much you'd sell it for instead of eBay'ing it!

Take Atarian care

I know this is a bit of a long shot....

The UK magazine "Atari User", published by Database Publications/Europress
had type-in listings and these were also available on a monthly disk or
cassette. I believe they were also made available for download on the
Microlink/Telecom Gold system. However, I've yet to find anyone in the world
who still has the disks or downloads ... can anyone report otherwise?

Similarly the UK magazine "Monitor" published by the UK Atari Computer
Owners Club apparently had a monthly disk containing the respective
programs. Again, I can't find anyone who still has copies of the disks....

If anyone has any leads on the whereabouts of these items, please let me
know!

Thanks,
PJR

> Do you mean the Internet Shop Sears?

Heh, maybe it's only an Internet Shop today, but way back when the VCS first came out, they were a major chain of department stores.

Sears, if I recall correctly, was one of the first places to sell video games, wide-spread. I believe Pong was sold in the sportings goods dept. ;) (I haven't cracked open any of my old books in a while, so this is off my terrible memory. And, shoot, I'm only 30yo!)

ANYWAY, back in the day, Sears _only_ sold Sears-branded stuff, so when Atari wanted to sell the VCS and various video games, it suddenly became the _"Sears"_ video game system, not "Atari". Numerous games had their names changed. Some games were only available through Sears, too, which is kind of odd. (Steeple Chase). (I _think_?)

Anyway, gotta get to the Vintage show!

Hi William!

I don't know Sears. Actually I found that Internetshop on the first
hits.

Fortunately we didn't have such marketing. Only real ATARI stuff were
available. I didn't (don't) have much, made in USA, but my (my Brother
and Mine) VCS2600 was one of that. I think I was 7 or 8 Years old, we
bought it very early _:-)), thanky to my mother :-).
A great VCS, we lend it very often and we forgot it one time, so it got
lost.
I am searching for a original VCS2600 (just as a collectible, and
sometimes playing on my TV-Set)
Is this really wood (veneers), on the VCS2600???

I have two 800XL too, but I never used them as a HC. Also not the C64.
But I use an ATARI TT with the TTM195 :-) - my bullion.

Kind Regards,

Daniel Mandic

Howdy Friends,

I am a newbie to 6502 assembler. The following code is a routine which
basically protects the screen borders after a X-adjustment of my mouse.

In C/Java style it's pretty easy:

CODE

```
x_new = mx+x
if (mx==positive) {
    if (x_new>x_max) {
     x=x_max
    } else {
     x=x_new;
     }
} else {
    if (x_new<0) {
    x=0
    } else {
    x=x_new;
    }
}
```

This is what I wrote in 6502 assembler (I am using MADS):
CODE

```
*************************
* Cursor X/Y/W/H manipulation

x_new   dta 0

cursor_add_x .local
;       in:  x= mx (x-pos diff)

        txa
        clc
        adc cursor_x
```

```
        sta x_new

        txa
        bmi _negativ   ; mx=negativ? yes -> _negativ
        lda x_new
        cmp MOD_max_x
        bcs _bigger_max
        lda x_new
        sta cursor_X
        rts

_bigger_max
        lda MOD_max_x
        sta cursor_X
        rts

_negativ
        lda x_new
        cmp #0
        bcs _bigger_equal
        lda #0
        sta cursor_X
        rts

_bigger_equal
        lda x_new
        sta cursor_X
        rts
```

Unfortunately it's not working. The right border (MOD_max_x) works good,
but the left border (0) doesn't seem to work at all.

I have difficulties to code something like "X<0" or "x>0" .. :-(..

what is wrong?

\twh

Howdy Ken, folks

> not expandable is the biggest problems with the BlackBox, MIO, Supra
> interfaces. and wow, your eyes are sure better then mine, I couldn't
> make out any of them. thanks for the links and the help.

The BlackBox can be made to share the bus with simple pieces of hardware
worth no more then half a euro (slightly over half a US dollar) I was
told years ago. Unfortunately, the guy who told me didn't trell me how
to do that. And nowadays, he isn't answering his email anymore.

And according to Bob Puff, the BlackBox can be expanded in a simular way
as is done with the FloppyBoard. I've had a look at the configuration
data, and there is room enough for extra data.

sometimes a multimeter doesn't tell you the whole story. best check is
to use an oscilloscope while the power supply is in use/under normal
load. anyway, best of luck to you. hope you get it sorted out.

I'm exhibiting my 8-bit families of Atari stuff at the
Vintage Computer Festival (VCF 8.0) in Mountain View, California this
weekend (see: http://www.vintage.org/)

I brought my:

  * Atari 800XL computer, with:
    + 256KB RAM upgrade
    + Its new MyIDE+MaxFlash IDE adapter cartridge...
      (plug in cartridge, turn on HDD, and voila!
      Tons of files and disk images available at high-speed!)
    + MaxFlash 1Mb flash cartridge (filled with a halfdozen games)
    + Numerous game cartridges

  * Atari 2600 VCS game system:
    + My family's original 4-switch wood-grain version
    + Dozens of carts (many from when I was a kid, many bought recently)
      (Yes, I bought a few more from a vendor at the Festival! :^P)

  * Two Atari Lynx handheld game systems:
    + Numerous game carts, including some recent releases (thanks, Carl!)
    + Comlynx cable (didn't get used during Day 1)

I've got photos of my exhibit (two 8' tables this year!), along with a few
other exhibits I had the chance to at least wander by with a camera. ;^)

  http://www.newbreedsoftware.com/bill/photos/vcf80/

Enjoy!

Thanks for posting the pics, I really enjoyed them. Too bad these things are
always so far away.

Hi Thomas,
  I think it's (at least partly) because of these lines:

>   lda x_new
>   cmp #0
>   bcs _bigger_equal

bcs will do an unsigned comparison between two numbers, it will branch
if x_new >=3D 0. But because it's an unsigned comparison, x_new will be
interpreted as a value between 0 and 255 inclusive, and any value

between 0 and 255 will always be >=3D 0, so it will always jump to
_bigger_equal.

I can see several places where the code can be made better too, and a
few potential problems. What are the maximum values of mx, x, and x_max
in the C/Java version of the code?
